CONNECTOR/GROUND LOCATIONS

DESCRIPTION 1

**CONNECTOR/GROUND
LOCATIONS****DESCRIPTION**

This section provides illustrations identifying connector and ground locations in the vehicle. A connector

and ground index is provided. Use the wiring diagrams in each section for connector and ground identification. Refer to the index for the proper figure number. For items that are not shown in this section N/S is placed in the Fig. column.

Connector Name/Number	Color	Location	Fig.
A/C Compressor Clutch	BK	At Compressor	1
A/C High Pressure Switch	BK	Near Radiator Fan Motor	10
A/C Low Pressure Switch	GY	Right Rear Engine Compartment	10
Airbag Control Module	YL	Below Center Floor Console, Near Park Brake	20, 22
Ambient Temperature Sensor	BK	On Radiator Center Support	10
Antena Module	WT	Above Right Quarter Window	25
Ash Receiver Lamp	BK	Below Cigarette Lighter	22
Automatic Day/Night Mirror	BK	In Front of Rear View Mirror	N/S
Automatic Headlamp Light Sensor/VTSS LED	BK	Near Left Instrument Panel Speaker	22
Automatic Zone Control Module C1 (AZC)	BK	Left Side of HVAC Housing	22
Automatic Zone Control Module C2 (AZC)	BK	Left Side of HVAC Housing	22
Battery Temperature Sensor	BK	Below Battery Tray	10
Blower Motor	BK	Behind Right Side of Instrument Panel	N/S
Blower Motor Controller (AZC)	BK	Behind Right Side of Instrument Panel	N/S
Blower Motor Resistor Block (MTC)	BK	Behind Right Side of Instrument Panel	N/S
Body Control Module C1	GY	Lower Left of Instrument Panel	23
Body Control Module C2	WT	Lower Left of Instrument Panel	23
Brake Lamp Switch	GY	Brake Pedal Arm	14
Brake Transmission Shift Interlock Solenoid	WT	Bottom of Steering Column	24
Brake Warning Indicator Switch	GY	At Master Cylinder	N/S
C100	BK	Right Front Engine Compartment	10
C102	BK	Right Rear Engine Compartment	2, 5, 9, 10

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
C103	GY	Right Rear Engine Compartment	2, 5, 9
C104	BK	Right Rear Engine Compartment	2, 9
C106	GY	Driver Side Near Kick Panel	12
C107	BK	Passenger Side Near Kick Panel	11, 14, 15
C108	BK	Left Cowl	11
C109	BK	Near Transfer Case Switch	N/S
C111	BK	Left Front Frame Near Windshield Washer Pump	11
C112	BK	Right Front Frame Near Horns	10
C200	GY	Passenger Side Near Kick Panel	12, 21, 22, 23
C201	WT	Below Center Floor Console, Near Park Brake	22
C202 (AZC)	WT	HVAC Unit Right Side of Instrument Panel	21, 22, 23
C202 (MTC)	WT	HVAC Unit Right Side of Instrument Panel	21, 22, 23
C203 (AZC)	WT	HVAC Unit Right Side Instrument Panel	21, 22, 23
C300	GY	Near Junction Block	13, 14, 15
C302	BK	Driver Door	14, 15, 18
C303	WT	Right Rear Door	12
C304	BK	Under Driver's Seat	13
C306	BK	Under Passenger Seat	12
C307	WT	Left Rear Door	13, 19
C308	WT	Top of Liftgate	16, 25
C309	WT	Left Rear Quarter Pillar	25
C310	LTGN	Above Left Quarter Wheel Housing	17, 25
C311	WT	Top of Liftgate	16
C312		Bottom Center of Liftgate	16
C313	WT	Driver's Door'	18
C314	LTGY	Passenger Door	14
C315		To Rear of Right Quarter Window	26
Camshaft Position Sensor	GY	Right Side of Engine	2, 5
Capacitor No. 1	BK	Right Side of Engine	2
Capacitor No. 2	BK	Left Side of Engine	1
Cargo Lamp	WT	In Headliner Near Liftgate	N/S
Center High Mounted Stop Lamp	BK	Top of Liftgate	N/S
Chime	BK	At Body Control Module	N/S
Cigar Lighter	RD	Center of Instrument Panel	22
Clockspring C1	GY	Steering Column	24
Clockspring C2	BK	Steering Column	24
Clockspring C3	YL	Steering Column	24
Coil On Plug No. 1 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.1	1

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Coil On Plug No. 2 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.2	2
Coil On Plug No. 3 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.3	1
Coil On Plug No. 4 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.4	2
Coil On Plug No. 5 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.5	1
Coil On Plug No. 6 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.6	2
Coil On Plug No. 7 (4.7L)	BK	Left Side of Engine Near Fuel Injector No.7	1
Coil On Plug No. 8 (4.7L)	BK	Right Side of Engine Near Fuel Injector No.8	2
Coil Rail	BK	Right Rear of Engine	5
Compact Disc Changer	BK	Right Rear Quarter Panel	25
Controller Antilock Brake	BK	Left Front Engine Compartment	11
Coolant Level Sensor	LTGY	Right Rear of Engine	10
Crankshaft Position Sensor	BK	Rear of Engine Near Transmission Bell Housing	2, 5
Cruise Switch No. 1	BK	On Steering Wheel	N/S
Cruise Switch No. 2	BK	On Steering Wheel	N/S
Data Link Connector	BK	Under Lower Driver's Side of Instrument Panel	23
Diagnostic Junction Port	WT	At Steering Column	24
Driver Blend Door Motor/Actuator (AZC)	BK	On HVAC Housing	N/S
Driver Cylinder Lock Switch	GY	In Driver Door	18
Driver Door Courtesy Lamp	BK	In Driver Door	N/S
Driver Door Lock Motor/Ajar Switch	BK	In Driver Door	18
Driver Door Module C1	WT	In Driver Door	18
Driver Door Module C2	BK	In Driver Door	N/S
Driver Door Module C3	BK	In Driver Door	N/S
Driver Front Power Window Motor	BK	In Driver Door	18
Driver Heated Seat Back	GN	At Driver Seat	N/S
Driver Heated Seat Cushion	BK	At Driver Seat	N/S
Driver Heated Seat Switch	WT	Center of Instrument Panel	22
Driver Lumbar Motor	BK	Under Driver's Seat	N/S
Driver Lumbar Switch	WT	Center of Instrument Panel	N/S
Driver Power Mirror	BK	At Driver Door	N/S
Driver Power Seat Front Riser Motor	RD	Under Driver's Seat	N/S

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
Driver Power Seat Front Riser Motor Sensor	BK	At Driver Seat	N/S
Driver Power Seat Horizontal Motor	BK	At Driver Seat	N/S
Driver Power Seat Horizontal Motor Sensor	BK	At Driver Seat	N/S
Driver Power Seat Rear Riser Motor	RD	At Driver Seat	N/S
Driver Power Seat Rear Riser Motor Sensor	BK	At Driver Seat	N/S
Driver Power Seat Recliner Motor	BK	At Driver Seat	N/S
Driver Power Seat Recliner Motor Sensor	BK	At Driver Seat	N/S
Driver Power Seat Switch	GN	At Driver Seat	N/S
Driver Rear Power Window Motor	BK	In Left Rear Door	19
Driver Rear Power Window Switch	BL	In Left Rear Door	19
Duty Cycle EVAP/Purge Solenoid	BK	Left Front Fender Near Controller Anti-Lock Brake	11
Electronic Speed Control Servo	BK	Right Front of Engine Compartment	10
Engine Coolant Temperature Sensor	BK	Front of Engine	1, 4
Engine Oil Pressure Sensor	BK	Side of Engine	1, 5
Front Power Outlet	RD	Center of Instrument Panel	22
Front Washer Pump	WT	Left Front of Engine Compartment	11
Front Wiper Motor	BK	Left Side of Cowl	11
Fuel Injector No. 1	BK	At Injector	1, 4
Fuel Injector No. 2	BK	At Injector	2, 4
Fuel Injector No. 3	BK	At Injector	1, 4
Fuel Injector No. 4	BK	At Injector	2, 4
Fuel Injector No. 5	BK	At Injector	1, 4
Fuel Injector No. 6	BK	At Injector	2, 4
Fuel Injector No. 7	BK	At Injector	1
Fuel Injector No. 8	BK	At Injector	2
Fuel Pump Module	BK	At Fuel Tank	13
G100 (4.0L)		Near Starter	N/S
G100		Near Battery	N/S
G101		Near Battery	N/S
G102		Right Side of Engine	2
G103		Right Side of Engine	2, 5
G104		Right Rear of Engine	1, 5
G106		Left Side of Engine Compartment	11
G107		Left Side of Engine Compartment	11

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
G108		Near Power Distribution Center	10
G200		Near Airbag Control Module	22, 23
G201		Near Airbag Control Module	20, 22
G300		Near Right Front Seat	N/S
G301		Near Left Front Seat	13
G-Switch	BK	Under Rear Seat	13
Generator	BK	At Generator	N/S
Glove Box Lamp	BK	Inside Glove Box	22
Hood Ajar Switch	BK	Left Side of Instrument Panel	N/S
Horn No. 1	BK	Right Front Fascia	10
Horn No. 2	BK	Right Front Fascia	10
Idle Air Control Motor	BK	Left Side of Engine Near Throttle Body	1, 4
Ignition Switch C1	WT	On Steering Column	24
Ignition Switch C2	BK	On Steering Column	24
Input Speed Sensor	BK	Left Side of Transmission	3
Instrument Cluster	WT	Behind Cluster	22
Intake Air Temperature Sensor	GY	Left Side of Engine	1, 4
Junction Block C1	BK	At Junction Block	13, 14, 15
Junction Block C2	BK	At Junction Block	15
Junction Block C3	BK	At Junction Block	21, 23
Junction Block C4	WT	At Junction Block	14, 15
Junction Block C5	WT	At Junction Block	15
Leak Detection Pump		Left Front Wheel Opening	11
Left Courtesy Lamp	BK	Left Side of Instrument Panel	24
Left Fog Lamp	BK	Left Front Fascia	11
Left Front Door Speaker	WT	In Left Front Door	18
Left Front Park Lamp	WT	At Lamp	N/S
Left Front Park/Turn Signal Lamp	BK	At Lamp	N/S
Left Front Side Marker Lamp	WT	At Lamp	N/S
Left Front Wheel Speed Sensor	GY	At Left Front Wheel Opening	N/S
Left Handle Courtesy Lamp	BK	At Lamp	N/S
Left High Beam Headlamp	BK	At Lamp	N/S
Left Instrument Panel Speaker	WT	At Speaker	22
Left Liftgate Ajar Switch	BK	In Liftgate	16
Left Low Beam Headlamp	GY	At Lamp	N/S
Left Multi-Function Switch	WT	On Steering Column	24
Left Rear Door Lock Motor/Ajar Switch	BK	In Left Rear Door	19
Left Rear Door Speaker		In Left Rear Door	19
Left Rear Lamp Assembly		At Lamp Assembly	25
Left Rear Wheel Speed Sensor	GY	Near Left Rear Wheel	13
Left Visor/Vanity Lamp	BK	At Visor	N/S

CONNECTOR/GROUND LOCATIONS (Continued)

Connector Name/Number	Color	Location	Fig.
License Lamp No. 1	BK	At Lamp	N/S
License Lamp No. 2	BK	At Lamp	N/S
Liftgate Flip-up Ajar Switch	GY	In Liftgate	16
Liftgate Flip-up Push Button Switch	BK	In Liftgate	N/S
Liftgate Flip-up Release Solenoid	BK	In Liftgate	16
Liftgate Lock Motor	BK	In Liftgate	16
Manifold Absolute Pressure Sensor (4.0)	BK	At Throttle Body	4
Manifold Absolute Pressure Sensor (4.7)		Right Side of Engine	1
Manual Temperature Control C1 (MTC)	WT	Center of Instrument Panel	22
Manual Temperature Control C2 (MTC)	WT	Center of Instrument Panel	22
Mode Door Motor/Actuator (AZC)	BK	Right Center of Instrument Panel	N/S
Output Speed Sensor (4.0L)	GY	Left Side of Transmission	6
Output Speed Sensor (4.7L)	BK	Left Side of Transmission	3
Overhead Map/Courtesy Lamp No.1		At Overhead Console	N/S
Overhead Map/Courtesy Lamp Switch No.1	BK	At Overhead Console	N/S
Overhead Map/Courtesy Lamp No.2		At Overhead Console	N/S
Overhead Map/Courtesy Lamp Switch No.2	BK	At Overhead Console	N/S
Oxygen Sensor 1/1 Upstream (4.0L)	GY	Left Side of Engine Before Front Catalytic Converter	7
Oxygen Sensor 1/1 Upstream (4.7L)	GY	Left Side of Engine at Exhaust	8
Oxygen Sensor 1/2 Downstream (4.0L)	GY	Left Side of Engine After Front Catalytic Converter	7
Oxygen Sensor 1/2 Downstream (4.7L)	GY	After Left Front Catalytic Converter	8
Oxygen Sensor 2/1 Upstream (4.0L)	GY	Left Side of Engine Before Rear Catalytic Converter	7
Oxygen Sensor 2/1 Upstream (4.7L)	GY	Right Side of Engine Before Right Front Catalytic Converter	8
Oxygen Sensor 2/2 Downstream (4.0L)	BK	Left Side of Engine After Rear Catalytic Converter	7
Oxygen Sensor 2/2 Downstream (4.7L)	GY	Right Side of Engine After Right Front Catalytic Converter	8
Park/Neutral Position Switch	BK	Left Side of Transmission	6
Passenger Airbag	YL	Passenger Side of Instrument Panel	22

CONNECTOR/GROUND LOCATIONS (Continued)

SPLICE LOCATIONS

DESCRIPTION 1

SPLICE LOCATIONS**DESCRIPTION**

This section provides illustrations identifying the general location of wiring splices in this vehicle. A

splice index is provided. Use the wiring diagrams in each section for splice number identification. Refer to index for proper splice number. For splices that are not shown in the figures N/S is placed in the Fig. column.

POWER DISTRIBUTION

DESCRIPTION

This group covers the various standard and optional power distribution components used on this model. The power distribution system for this vehicle consists of the following components:

- Power Distribution Center (PDC)
- Junction Block (JB)
- Power Outlets.

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Bus bars
- Cartridge fuses
- Circuit splice blocks
- Flashers
- Fusible links
- Relays.

Following are general descriptions of the major components in the power distribution system. See the owner's manual in the vehicle glove box for more information on the features and use of all of the power distribution system components. Refer to Wiring Diagrams for complete circuit diagrams.

OPERATION - POWER DISTRIBUTION SYSTEM

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the vehicle technician to use when conducting diagnosis and repair of faulty circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories

POWER DISTRIBUTION (Continued)

that the vehicle owner may choose to have installed in the aftermarket.

NOTE: DO NOT ATTEMPT TO SWAP POWER DISTRIBUTION CENTERS (PDC) FROM ONE VEHICLE TO ANOTHER. MOST OF THESE ASSEMBLIES ARE VEHICLE FEATURE SPECIFIC AND THEREFORE NOT INTERCHANGEABLE. ALWAYS USE THE CORRECT PART NUMBERED ASSEMBLY WHEN DIAGNOSING OR REPLACING A PDC.

SPECIAL TOOLS

POWER DISTRIBUTION SYSTEMS

Terminal Pick Kit 6680

CIGAR LIGHTER OUTLET

DESCRIPTION

A cigar lighter receptacle is standard equipment on this model. On models equipped with the optional Smoker's Package, the cigar lighter knob and heating element are included. On models without the Smoker's Package, the cigar lighter receptacle is equipped with a snap fit plastic cap and is treated as an extra accessory power outlet. The cigar lighter receptacle is installed in the instrument panel center lower bezel, which is located near the bottom of the instrument panel center stack area, below the heater and air conditioner controls. The cigar lighter base is secured by a snap fit within the center lower bezel.

The cigar lighter receptacle, plastic cap and the knob and heating element unit are available for service replacement. These components cannot be repaired and, if faulty or damaged, they must be replaced.

OPERATION

The cigar lighter consists of two major components: a knob and heating element unit, and the cigar

lighter base or receptacle shell. The receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The cigar lighter receives battery voltage from a fuse in the junction block through the cigar lighter relay only when the ignition switch is in the Accessory or On positions. Refer to **Cigar Lighter Relay** in the Description and Operation section of this group for more information on this component.

The cigar lighter knob and heating element are encased within a spring-loaded housing, which also features a sliding protective heat shield. When the knob and heating element are inserted in the receptacle shell, the heating element resistor coil is grounded through its housing to the receptacle shell. If the cigar lighter knob is pushed inward, the heat shield slides up toward the knob exposing the heating element, and the heating element extends from the housing toward the insulated contact in the bottom of the receptacle shell.

Two small spring-clip retainers are located on either side of the insulated contact inside the bottom of the receptacle shell. These clips engage and hold the heating element against the insulated contact long enough for the resistor coil to heat up. When the heating element is engaged with the contact, battery current can flow through the resistor coil to ground, causing the resistor coil to heat.

When the resistor coil becomes sufficiently heated, excess heat radiates from the heating element causing the spring-clips to expand. Once the spring-clips expand far enough to release the heating element, the spring-loaded housing forces the knob and heating element to pop back outward to their relaxed position. When the cigar lighter knob and element are pulled out of the receptacle shell, the protective heat shield slides downward on the housing so that the heating element is recessed and shielded around its circumference for safety.

DIAGNOSIS & TESTING - CIGAR LIGHTER OUTLET

For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

CIGAR LIGHTER OUTLET (Continued)

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the On position. Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, refer to **Cigar Lighter Relay** in the Diagnosis and Testing section of this group.

(3) Remove the cigar lighter knob and element from the cigar lighter receptacle shell. Check for continuity between the inside circumference of the cigar lighter receptacle shell and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Turn the ignition switch to the On position. Check for battery voltage at the insulated contact located at the back of the cigar lighter receptacle shell. If OK, replace the faulty cigar lighter knob and element. If not OK, go to Step 5.

(5) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the instrument panel center lower bezel. Check for continuity between the ground circuit cavity of the cigar lighter wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Turn the ignition switch to the Accessory or On positions. Check for battery voltage at the fused B(+) circuit cavity of the cigar lighter wire harness connector. If OK, replace the faulty cigar lighter receptacle. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

CIGAR LIGHTER OUTLET
DOOR SPRING

REMOVAL

(1) Disconnect and isolate the negative battery cable.

(2) Remove the instrument panel center lower bezel from the I.P. Refer to Body for the procedure.

(3) Remove the cigar lighter outlet door spring from its locating holes (Fig. 1).

INSTALLATION

(1) Install the cigar outlet door spring in its locating holes.

(2) Install the instrument panel center lower bezel on the I.P. Refer to Body for the procedure.

(3) Connect the negative battery cable.

80950645

Fig. 1 Cigar Lighter Outlet Door Spring

2 - CIGAR LIGHTER OUTLET DOOR SPRING

IGNITION-OFF DRAW FUSE

DESCRIPTION

All vehicles are equipped with an Ignition-Off Draw (IOD) fuse (Fig. 2) that is removed from its cavity in the Power Distribution Center (PDC) when the vehicle is shipped from the factory. Dealer personnel are to remove the IOD fuse from the storage location and install it into PDC fuse cavity 15 as part of the preparation procedures performed just prior to new vehicle delivery.

The PDC has a molded plastic cover that can be removed to provide service access to all of the fuses and relays in the PDC. An integral latch and hinges are molded into the PDC cover for easy removal. A fuse layout map is integral to the underside of the PDC cover to ensure proper fuse and relay identification. The IOD fuse is a 50 ampere maxi-type cartridge fuse and, when removed, it is stored in a spare fuse cavity within the PDC.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD fuse feeds the memory and sleep mode functions for some of the electronic modules in the vehicle as well as various other accessories that require battery current when the ignition switch is in the Off position,

IOD FUSE (Continued)

Fig. 2 Ignition-Off Draw Fuse

- 1 - POWER DISTRIBUTION CENTER
- 2 - IGNITION-OFF DRAW FUSE
- 3 - IOD FUSE STORAGE CAVITY

including the clock. The only reason the IOD fuse is removed is to reduce the normal IOD of the vehicle electrical system during new vehicle transportation and pre-delivery storage to reduce battery depletion, while still allowing vehicle operation so that the vehicle can be loaded, unloaded and moved as needed by both vehicle transportation company and dealer personnel.

The IOD fuse is removed from PDC fuse cavity 15 when the vehicle is shipped from the assembly plant. Dealer personnel must install the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation. Once the vehicle is prepared for delivery, the IOD function of this fuse becomes transparent and the fuse that has been assigned the IOD designation becomes only another Fused B(+) circuit fuse. The IOD fuse serves no useful purpose to the dealer technician in the service or diagnosis of any vehicle system or condition, other than the same purpose as that of any other standard circuit protection device.

The IOD fuse can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about thirty days. However, it must be remembered that removing the IOD fuse will not eliminate IOD, but only reduce this normal condition. If a vehicle will be stored for more than about thirty days, the battery negative cable should be discon-

nected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Battery System** for additional service information.

REMOVAL

The Ignition-Off Draw (IOD) fuse is removed from Power Distribution Center (PDC) fuse cavity 15 (Fig. 2) when the vehicle is shipped from the assembly plant. Dealer personnel must install the IOD fuse when the vehicle is being prepared for delivery in order to restore full electrical system operation.

- (1) Turn the ignition switch to the Off position.
- (2) Unlatch and open the cover of the PDC.
- (3) Remove the IOD fuse from fuse cavity 15 of the PDC.
- (4) Store the removed IOD fuse by installing it in the unused fuse storage cavity 11 of the PDC.
- (5) Close and latch the PDC cover.

INSTALLATION

- (1) Turn the ignition switch to the Off position.
- (2) Unlatch and open the cover of the PDC.
- (3) Remove the stored IOD fuse from fuse storage cavity 11 of the PDC.
- (4) Use a thumb to press the IOD fuse firmly down into PDC fuse cavity 15.
- (5) Close and latch the PDC cover.

JUNCTION BLOCK

DESCRIPTION

An electrical Junction Block (JB) is concealed beneath the driver side of the instrument panel in the passenger compartment of the vehicle (Fig. 3). The JB combines the functions previously provided by a separate fuseblock module and relay center. The JB serves to simplify and centralize numerous electrical components, as well as to distribute electrical current to many of the accessory systems in the vehicle. It also eliminates the need for numerous splice connections. The JB houses up to thirty-three blade-type mini fuses, up to two blade-type automatic resetting circuit breakers, the electronic combination flasher, the Daytime Running Lamp (DRL) module (Canada only) and up to twelve International Standards Organization (ISO) relays (three standard-type and nine micro-type). The JB also incorporates an integral connector and mounting for the Body Control Module (BCM). The BCM is secured with four screws directly to the dash panel side of the JB. Refer to **Body Control Module** in Electronic Control Modules for additional information covering the BCM.

JUNCTION BLOCK (Continued)

**Fig. 3 Junction Block Location**

- 1 - REAR LATCHES
- 2 - JUNCTION BLOCK AND BODY CONTROL MODULE UNIT
- 3 - INSTRUMENT PANEL FUSE COVER
- 4 - SIDE LATCH
- 5 - FRONT LATCHES

The molded plastic JB housing has integral mounts that are secured with two screws and two snap retainers to the instrument panel steering column support bracket behind the instrument panel steering column opening cover. The JB is concealed above the molded plastic instrument panel fuse cover. Integral latches molded into the fuse cover secure it the JB, the BCM and the 16-way data link connector tab of the instrument panel steering column support bracket. The fuse cover can be pulled downward to disengage the latches and provide service access to all of the fuses, relays and wire harness connectors of the JB. The fuse cover has a fuse puller and spare fuses secured to its upper surface. Refer to **Instrument Panel Fuse Cover** in Body for additional service information.

The JB unit cannot be repaired and is only serviced as an assembly. If any internal circuit or the JB housing is faulty or damaged, the entire JB unit must be replaced. The BCM is available for separate service replacement.

OPERATION

All of the circuits entering and leaving the Junction Block (JB) do so through up to five wire harness connectors, which are connected to the JB through integral connector receptacles molded into the JB housing. Internal connection of all of the JB circuits is accomplished by a printed circuit board. There are also two separate wire harness connections to connector receptacles that are integral to the BCM. Refer to **Junction Block** in Wiring Diagrams for

additional information and the location of complete JB circuit diagrams.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the fuse cover from the bottom of the Junction Block (JB). Refer to **Instrument Panel Fuse Cover** in Body for the location of the fuse cover removal procedures.

(3) Remove the steering column opening cover from the instrument panel. Refer to **Steering Column Opening Cover** in Body for the location of steering column opening cover removal procedures.

(4) Reach behind the JB to disconnect the two instrument panel wire harness connectors from the Body Control Module (BCM) connector receptacles located near the bottom of the JB (Fig. 4).

(5) Reach behind the JB to remove the screw that secures the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB and disconnect the connector.

(6) Disconnect the fused B(+) and the IOD wire harness connectors from the connector receptacles located near the bottom of the JB (Fig. 5).

(7) Remove the screws that secure the right and left body wire harness bulkhead connectors to the connector receptacles located near the center of the JB and disconnect the connectors.

(8) Remove the two screws that secure the JB to the instrument panel steering column support bracket (Fig. 6).

(9) To disengage the two snap clips that secure the top of the JB to the instrument panel steering column support bracket, grasp the bottom of the junction block firmly with both hands and pull it downward sharply.

(10) Remove the JB from the instrument panel steering column support bracket.

JUNCTION BLOCK (Continued)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: If the Junction Block (JB) is being replaced with a new unit, be certain to transfer each of the optional fuses, circuit breakers and relays from the faulty JB to the proper cavities of the replacement JB. Refer to Junction Block in Wiring Diagrams for the location of complete circuit diagrams and cavity assignments for the JB. The Body Control Module (BCM) must also be transferred to the new JB. Refer to Body Control Module in Electronic Control Modules for the location of the BCM removal and installation procedures.

- 10 - JUNCTION BLOCK

(1) Position the JB into its mounting location on the instrument panel steering column support bracket.

(2) Align the snap clips at the top of the JB with the mounting holes in the instrument panel steering column support bracket.

(3) Grasp the bottom of the JB firmly with both hands and push it upward sharply to engage the two snap clips that secure the top of the JB to the instrument panel steering column support bracket.

(4) Install and tighten the two screws that secure the JB to the instrument panel steering column support bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reconnect the right and left body wire harness bulkhead connectors to the connector receptacles located near the center of the JB.

(6) Install and tighten the screws that secure the right and left body wire harness bulkhead connectors

JUNCTION BLOCK (Continued)

to the connector receptacles located near the center of the JB. Tighten the screws to 2.2 N·m (20 in. lbs.).

(7) Reconnect the fused B(+) and the IOD wire harness connectors to the connector receptacles located near the bottom of the JB.

(8) Reach behind the JB to reconnect the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB.

(9) Install and tighten the screw that secures the instrument panel wire harness bulkhead connector to the connector receptacle located near the top of the JB. Tighten the screw to 2.2 N·m (20 in. lbs.).

(10) Reach behind the JB to reconnect the two instrument panel wire harness connectors to the BCM connector receptacles located near the bottom of the JB.

(11) Install the steering column opening cover onto the instrument panel. Refer to **Steering Column Opening Cover** in Body for the location of the steering column opening cover installation procedures.

(12) Install the fuse cover onto the bottom of the JB. Refer to **Instrument Panel Fuse Cover** in Body for the location of the fuse cover installation procedures.

(13) Reconnect the battery negative cable.

POWER DISTRIBUTION CENTER

DESCRIPTION

All of the electrical current distributed throughout this vehicle is directed through the standard equip-

**Fig. 7 Power Distribution Center Location**

- 1 - RIGHT FENDER
- 2 - BATTERY
- 3 - POWER DISTRIBUTION CENTER
- 4 - COVER

ment Power Distribution Center (PDC) (Fig. 7). The molded plastic PDC housing is located in the right front corner of the engine compartment, between the battery and the right front inner fender shield. The PDC houses up to fifteen maxi-type cartridge fuses, which replace all in-line fusible links. The PDC also houses up to thirteen blade-type mini fuses, and up to ten International Standards Organization (ISO) relays (two standard-type and eight micro-type).

The PDC housing is secured in the engine compartment at three points. Integral mounts on both sides of the PDC housing engage and latch to stanchions that are integral to the molded plastic battery support. The PDC is integral to the right headlamp and dash wire harness, which exits from the bottom of the PDC housing. The PDC housing has a molded plastic cover that includes two integral latches at the front and pivot hooks at the back that snap over a hinge pin on the rear of the PDC housing. The PDC cover is easily opened or removed for service access and has a convenient fuse and relay layout map integral to the inside surface of the cover to ensure proper component identification. A fuse puller is also stored on the inside of the PDC cover.

The PDC cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC main housing unit, the

POWER DISTRIBUTION CENTER (Continued)

fuse wedges and the bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, fuse wedges or the bus bars are faulty or damaged, the right headlamp and dash wire harness unit must be replaced.

OPERATION

All of the current from the battery and the generator output enters the PDC through two cables and a single two-holed eyelet that is secured with nuts to the two PDC B(+) terminal studs just inside the front end of the PDC housing. The PDC cover is unlatched and opened to access the battery and generator output connection B(+) terminal studs, the fuses or the relays. Internal connection of all of the PDC circuits is accomplished by an intricate combination of hard wiring and bus bars. Refer to **Power Distribution** in Wiring Diagrams for the location of complete PDC circuit diagrams.

REMOVAL

The Power Distribution Center (PDC) main housing unit, the PDC fuse wedges and the PDC bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, the fuse wedges or the bus bars are faulty or damaged, the entire PDC and right headlamp and dash wire harness unit must be replaced.

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect each of the right headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness connector locations.

(3) Remove all of the fasteners that secure each of the right headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.

(4) Disengage each of the retainers that secure the right headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness retainer locations.

(5) Unlatch and open the PDC cover.

(6) Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take outs to the PDC B(+) terminal studs (Fig. 8).

(7) Remove the battery wire harness PDC take out eyelet from the B(+) terminal studs.

Fig. 8 Power Distribution Center Connections

- 1 - PDC COVER
- 2 - NUT (2)
- 3 - EYELET
- 4 - B(+) TERMINAL STUDS

(8) Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions of the battery support, and pull the PDC housing upward to disengage the mounts from the stanchions (Fig. 9).

(9) Remove the PDC and the right headlamp and dash wire harness from the engine compartment as a unit.

PDC & COMPONENTS DISASSEMBLY

PDC HOUSING LOWER COVER

DISASSEMBLY

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the battery from the battery support. Refer to **Battery System** for the location of the battery removal procedures.

POWER DISTRIBUTION CENTER (Continued)

Fig. 10 PDC Housing Lower Cover Remove/Install

- 1 - TROUGH FORMATION
- 2 - LATCHES (5)
- 3 - PDC HOUSING LOWER COVER
- 4 - WIRE HARNESS

(2) Unlatch and remove the cover from the PDC.

(3) Remove the two nuts that secure the two-holed eyelet of the battery wire harness PDC take out to the B(+) terminal studs near the front of the PDC.

(4) Remove the battery wire harness PDC take out eyelet from the two PDC B(+) terminal studs.

(5) Disengage the latches on the PDC housing mounts from the tabs on the PDC mounting stanchions on the battery support, and pull the PDC housing upward to disengage the mounts from the stanchions.

(6) Where the right headlamp and dash wire harness exits the PDC, remove the tape that secures the wire harness to the trough formation on the PDC housing lower cover.

(7) Using a trim stick or another suitable wide flat-bladed tool, gently pry the latches on each side and the front of the PDC housing that secure the housing lower cover to the PDC and remove the housing lower cover (Fig. 10).

PDC B+ TERMINAL MODULE**DISASSEMBLY**

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed

from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(1) Remove the PDC housing lower cover.

(2) From the top of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches that secure the B(+) terminal module in the PDC.

(3) Gently and evenly press the two B(+) terminal studs down through the bus bar in the PDC.

(4) From the bottom of the PDC housing, remove the B(+) terminal module from the PDC.

PDC RELAY WEDGE**DISASSEMBLY**

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring**

POWER DISTRIBUTION CENTER (Continued)

Repair in Wiring Diagrams for the location of the wiring repair procedures.

- (1) Remove the PDC housing lower cover.
- (2) Remove each of the relays from the PDC relay wedge to be removed.
- (3) From the bottom of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches (yellow) that secure the relay wedge to the PDC relay cassette.
- (4) From the top of the PDC housing, remove the relay wedge from the PDC relay cassette (Fig. 11).

Fig. 11 PDC Relay Wedge Remove/Install

- 1 - RELAY WEDGE (TYPICAL)
- 2 - PDC HOUSING
- 3 - RELAY WEDGE (TYPICAL)
- 4 - PDC HOUSING

80be4542

NOTE: It may be necessary to remove relay cassettes that are not being serviced from the PDC housing in order to obtain sufficient clearance to access the faulty relay cassette. The same service procedure is repeated as necessary to remove each of the interfering relay wedges and relay cassettes from the PDC housing.

- (2) From the top of the PDC housing, use a small screwdriver or a terminal pick tool (Special Tool Kit 6680) to release the two latches that secure the relay cassette in the PDC (Fig. 12).

80be4543

PDC RELAY CASSETTE

DISASSEMBLY

The Power Distribution Center (PDC) cover, the PDC housing lower cover, the PDC relay wedges, the PDC relay cassettes and the PDC B(+) terminal stud module are available for service replacement. The PDC cover can be simply unlatched and removed from the PDC housing without the PDC being removed or disassembled. Service of the remaining PDC components requires that the PDC be removed from its mounting and disassembled. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

- (1) Remove the relay wedge from the PDC relay cassette to be removed.

- (3) Gently and evenly press the relay cassette down through the PDC housing.

- (4) From the bottom of the PDC housing, remove the relay cassette from the PDC (Fig. 13).

CAUTION: Do not remove the wiring and terminals from the terminal cavities of the faulty PDC relay cassette at this time. Refer to the Assembly procedure that follows for the proper procedures for transferring the wiring and terminals to the replacement PDC relay cassette.

POWER DISTRIBUTION CENTER (Continued)

**Fig. 13 PDC Relay**

- 2 - PDC RELAY CASSETTE (TYPICAL)
- 3 - LATCHES
- 4 - PDC HOUSING
- 5 - PDC RELAY CASSETTE (TYPICAL)
- 6 - LATCHES

80be4544

RELAY CASSETTE**ASSEMBLY**

(1) Move the faulty PDC relay cassette with its wiring away from the bottom of the PDC housing far enough to allow the replacement relay cassette to be installed into the PDC.

(2) Using the faulty relay cassette as a guide, be certain that the replacement relay cassette is correctly oriented before installing it into the PDC housing.

(3) From the bottom of the PDC housing, align and insert the replacement relay cassette into the PDC. Press the relay cassette up into the PDC until both of the latches are fully engaged.

CAUTION: Proper care must be taken to be certain that the wiring and terminals from the faulty PDC relay cassette are installed in the correct terminal cavities of the replacement relay cassette. To prevent mistakes it is recommended that the wiring and terminals be removed from the faulty relay cassette one cavity at a time, repaired or spliced as necessary, then installed securely into the correct cavity of the replacement relay cassette. If you are not absolutely certain into which cavity a terminal should be installed, refer to Power Distribution in the index of this service manual for the location of complete circuit diagrams covering the PDC.

PDC & COMPONENTS ASSEMBLY**PDC B(+) TERMINAL MODULE****ASSEMBLY**

(1) From the bottom of the PDC housing, align and insert the B(+) terminal module into the PDC.

(2) From the bottom of the PDC housing, align and insert the two studs of the PDC B(+) terminal module through the bus bar in the PDC.

(3) From the bottom of the PDC housing, press the B(+) terminal module gently and evenly into the PDC until both of the latches are fully engaged.

(4) Install the PDC housing lower cover.

RELAY WEDGE**ASSEMBLY**

(1) From the top of the PDC housing, align and insert the PDC relay wedge latch arms into the correct cavities in the relay cassette.

(2) Gently and evenly press the PDC relay wedge down into the relay cassette until both of the latches are fully engaged.

(3) Install each of the removed relays into the proper cavities of the PDC relay wedge.

(4) Install the PDC housing lower cover.

(4) While pulling gently on the wire from the bottom of the faulty PDC relay cassette, use a terminal pick tool (Special Tool Kit 6680) from the top of the relay cassette to release the latch that secures the terminal in the relay cassette terminal cavity (Fig. 14).

(5) From the bottom of the faulty PDC relay cassette, remove the wire and terminal from the relay cassette terminal cavity.

(6) Make all necessary repairs and splices to the wire for the removed terminal. Refer to **Wiring Repair** in Wiring Diagrams for the location of the wiring repair procedures.

(7) From the bottom of the PDC housing, align and insert the removed wire and terminal into the correct terminal cavity of the replacement relay cassette. Push the wire and terminal up into the relay cassette terminal cavity until it is fully engaged by the latch.

(8) Repeat Step 4, Step 5, Step 6 and Step 7 one wire and terminal at a time until each of the wires and terminals have been transferred from the faulty PDC relay cassette into the replacement relay cassette.

(9) Install the PDC relay wedge into the replacement PDC relay cassette.

POWER DISTRIBUTION CENTER (Continued)

PDC LOWER COVER

ASSEMBLY

- (1) Align the PDC housing lower cover on the bottom of the PDC.
- (2) Evenly press the lower cover into place until latches are fully engaged.
- (3) Where the right headlamp and dash harness enters the PDC, tape the harness securely to the trough formation on the PDC lower cover.
- (4) Install the PDC in its mounting location on the battery support.
- (5) Install the battery wire harness over the two PDC B+ terminal studs. Torque the nuts to 11.3 N·m (100 in. lbs.).
- (6) Install the battery. Refer to Battery System for the procedure.
- (7) Install the PDC cover.

INSTALLATION

The Power Distribution Center (PDC) main housing unit, the PDC fuse wedges and the PDC bus bars cannot be repaired and are only serviced as a unit with the right headlamp and dash wire harness. If the PDC main housing unit, the fuse wedges or the bus bars are faulty or damaged, the entire PDC and

right headlamp and dash wire harness unit must be replaced.

(1) Position the PDC and the right headlamp and dash wire harness unit in the engine compartment.

(2) Engage the PDC housing mounts with the stanchions of the battery support and push the unit downward until the mount latches fully engage the mounting tabs on the stanchions.

(3) Install the two-holed eyelet of the battery wire harness PDC take outs onto the two PDC B(+) terminal studs.

(4) Install and tighten the nuts that secure the eyelet of the battery wire harness PDC take outs to the B(+) terminal studs. Tighten the nuts to 11.3 N·m (100 in. lbs.).

(5) Engage each of the retainers that secure the right headlamp and dash wire harness to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness retainer locations.

(6) Install all of the fasteners that secure each of the right headlamp and dash wire harness ground eyelets to the vehicle body and chassis components. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the ground eyelet locations.

(7) Reconnect each of the right headlamp and dash wire harness connectors. Refer to **Connector Locations** in Wiring Diagrams for the location of more information on the right headlamp and dash wire harness connector locations. For connectors secured with screws, tighten the screws to 4.3 N·m (38 in. lbs.).

(8) Reconnect the battery negative cable.

POWER OUTLET

DESCRIPTION - FRONT POWER OUTLET

An accessory power outlet is standard equipment on this model. The power outlet is installed in the instrument panel center lower bezel, which is located near the bottom of the instrument panel center stack area, below the heater and air conditioner controls. The power outlet base is secured by a snap fit within the center lower bezel. A hinged door with an over-center spring flips closed to conceal and protect the power outlet base when the power outlet is not being used, and flips open below the center lower bezel while the power outlet is in use.

The power outlet receptacle unit and the power outlet door are each available for service replacement.

POWER OUTLET (Continued)

DESCRIPTION - REAR POWER OUTLET

A rear accessory power outlet is optional equipment on this model. The rear power outlet is installed in the lower right quarter trim panel near the right liftgate opening pillar in the cargo area of the vehicle. The power outlet base and mount are secured by a snap fit within the quarter trim panel. A plastic protective cap snaps into the power outlet base when the power outlet is not being used, and hangs from the power outlet base mount by an integral bail strap while the power outlet is in use. While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

The power outlet receptacle unit and the accessory power outlet protective cap are available for service. The power outlet receptacle cannot be repaired and, if faulty or damaged, it must be replaced.

OPERATION - FRONT POWER OUTLET

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the junction block at all times.

While the power outlet is very similar to a cigar lighter base unit, it does not include the two small spring-clip retainers inside the bottom of the receptacle shell that are used to secure the cigar lighter heating element to the insulated contact.

OPERATION - REAR POWER OUTLET

The power outlet base or receptacle shell is connected to ground, and an insulated contact in the bottom of the shell is connected to battery current. The power outlet receives battery voltage from a fuse in the Power Distribution Center (PDC) through a fuse in the Junction Block (JB) at all times. Refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams for the location of complete rear power outlet circuit diagrams.

DIAGNOSIS & TESTING - FRONT POWER OUTLET

For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL

AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the junction block. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.

(3) Open the power outlet door. Check for continuity between the inside circumference of the power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the instrument panel center lower bezel. Check for continuity between the ground circuit cavity of the power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the power outlet wire harness connector. If OK, replace the faulty power outlet receptacle. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

DIAGNOSIS & TESTING - REAR POWER OUTLET

Refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams for the location of complete rear power outlet circuit diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check the fused B(+) fuse in the Junction Block (JB). If OK, go to Step 2. If not OK, repair the

POWER OUTLET (Continued)

shorted circuit or component as required and replace the faulty fuse.

(2) Check for battery voltage at the fused B(+) fuse in the JB. If OK, go to Step 3. If not OK, repair the open fused B(+) circuit to the Power Distribution Center (PDC) as required.

(3) Remove the plastic protective cap from the rear power outlet receptacle. Check for continuity between the inside circumference of the rear power outlet receptacle and a good ground. There should be continuity. If OK, go to Step 4. If not OK, go to Step 5.

(4) Check for battery voltage at the insulated contact located at the back of the rear power outlet receptacle. If not OK, go to Step 5.

(5) Disconnect and isolate the battery negative cable. Remove the rear power outlet from the right quarter trim panel. Check for continuity between the ground circuit cavity of the rear power outlet wire harness connector and a good ground. There should be continuity. If OK, go to Step 6. If not OK, repair the open ground circuit to ground as required.

(6) Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity of the rear power outlet wire harness connector. If OK, replace the faulty rear power outlet receptacle base. If not OK, repair the open fused B(+) circuit to the JB fuse as required.

REMOVAL - FRONT POWER OUTLET

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center lower bezel from the instrument panel. Refer to **Instrument Panel Center Lower Bezel** in Body for the procedure.

(3) Pull the cigar lighter knob and element or the protective cap out of the cigar lighter receptacle base, or open the power outlet door in the instrument panel center lower bezel.

(4) Look inside the cigar lighter or power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the instrument panel center lower bezel (Fig. 15).

(5) Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

80a95367

Fig. 15 Cigar Lighter and Power Outlet Remove/Install - Typical

- 1 - RIGHT QUARTER TRIM PANEL
- 2 - RIGHT BODY WIRE HARNESS CONNECTOR
- 3 - RECEPTACLE BASE
- 4 - PROTECTIVE CAP
- 5 - MOUNT

(3) Look inside the rear power outlet receptacle base and note the position of the rectangular retaining bosses of the mount that secures the receptacle base to the right quarter trim panel (Fig. 17).

(4) Insert a pair of external snap ring pliers into the rear power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.

(5) Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.

(6) Pull the rear power outlet receptacle base away from the right quarter trim panel far enough to access the wire harness connector.

(7) Disconnect the right body wire harness connector from the rear power outlet receptacle base connector receptacle.

(8) Remove the rear power outlet mount from the right quarter trim panel.

INSTALLATION - FRONT POWER OUTLET

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN,

Fig. 17 Power Outlet Remove/Install - Typical

OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Install the cigar lighter or power outlet mount into the instrument panel center lower bezel.

(2) Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(3) Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(4) Install the cigar lighter knob and element or the protective cap into the cigar lighter receptacle base, or close the power outlet door in the instrument panel center lower bezel.

(5) Install the center lower bezel onto the instrument panel. Refer to **Instrument Panel Center Lower Bezel** in Body for the procedure.

(6) Reconnect the battery negative cable.

POWER OUTLET (Continued)

INSTALLATION - REAR POWER OUTLET

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Align the splines on the outside of the rear power outlet receptacle base connector receptacle with the grooves on the inside of the mount.

(2) Insert the rear power outlet receptacle base about half way through the mount.

(3) Reconnect the right body wire harness connector to the rear power outlet receptacle base connector receptacle.

(4) Insert the rear power outlet receptacle base and mount into the right quarter trim panel as a unit until the mount is seated flush against the trim panel.

(5) Press firmly on the rear power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.

(6) Install the protective cap into the rear power outlet receptacle base.

(7) Reconnect the battery negative cable.

POWER OUTLET RELAY

DESCRIPTION

The power outlet / cigar lighter relay is an electromechanical device that switches fused battery current to the cigar lighter or power outlet when the ignition switch is turned to the Accessory or On positions. The power outlet / cigar lighter relay is located in the junction block, below the driver side of the instrument panel in the passenger compartment.

The cigar lighter relay is a International Standards Organization (ISO) relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns, and terminal functions.

The cigar lighter relay cannot be repaired or adjusted and, if faulty or damaged, it must be replaced.

OPERATION

The ISO relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor or diode is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

DIAGNOSIS & TESTING - POWER OUTLET RELAY

The power outlet / cigar lighter relay (Fig. 18) is located in the junction block, below the driver side end of the instrument panel in the passenger compartment. For complete circuit diagrams, refer to **Horn/Cigar Lighter/Power Outlet** in Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the power outlet / cigar lighter relay from the junction block. Refer to **Power Outlet Relay** in the Removal and Installation section of this group for the procedure.

(2) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 4. If not OK, replace the faulty relay.

(4) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, perform the Relay Circuit Test that follows. If not OK, replace the faulty relay.

DIAGNOSIS & TESTING - RELAY CIRCUIT TEST

(1) The relay common feed terminal cavity (30) of the junction block is connected to battery voltage and should be hot at all times. Check for battery voltage

POWER OUTLET RELAY (Continued)

**Fig. 18 Cigar Lighter Relay**

TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

at the fused B(+) circuit cavity in the junction block receptacle for the cigar lighter relay. If OK, go to Step 2. If not OK, repair the fused B(+) circuit to the Power Distribution Center (PDC) fuse as required.

(2) The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.

(3) The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the fused B(+) fuse in the junction block that feeds the cigar lighter when the relay is energized by the ignition switch. There should be continuity between the junction block cavity for relay terminal 87 and the fused B(+) fuse in the junction block at all times. If OK, go to Step 4. If not OK, repair the open fused B(+) circuit to the junction block fuse as required.

(4) The coil ground terminal (85) is connected to the electromagnet in the relay. It receives battery feed to energize the cigar lighter relay when the ignition switch is in the Accessory or On positions. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (acc/run) circuit cavity for relay terminal 85 in the junction block receptacle for the cigar lighter relay. If OK, go to Step 5. If not OK, repair the open fused ignition switch output (acc/run) circuit to the ignition switch as required.

(5) The coil battery terminal (86) is connected to the electromagnet in the relay. The junction block cavity for this terminal should have continuity to

ground at all times. If not OK, repair the open ground circuit to ground as required.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the steering column opening cover from the instrument panel. Refer to **Steering Column Opening Cover** in Body for the procedure.

(3) The power outlet / cigar lighter relay is located on the left side of the combination flasher in the junction block.

(4) Remove the power outlet / cigar lighter relay from the junction block.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the power outlet / cigar lighter relay in the proper receptacle in the junction block.

(2) Align the power outlet / cigar lighter relay terminals with the terminal cavities in the junction block receptacle.

(3) Push in firmly on the power outlet / cigar lighter relay until the terminals are fully seated in the terminal cavities in the junction block receptacle.

(4) Install the steering column opening cover onto the instrument panel. Refer to **Steering Column Opening Cover** in Body for the procedure.

(5) Reconnect the battery negative cable.

IGNITION-OFF DRAW WIRE HARNESS CONNECTOR**DESCRIPTION**

All vehicles are equipped with an Ignition-Off Draw (IOD) connector that is located in a molded

IGNITION-OFF DRAW WIRE HARNESS CONNECTOR (Continued)

Fig. 19 Ignition-Off Draw Connector

- 1 - SNAP CLIPS
- 2 - SCREW
- 3 - BULKHEAD CONNECTOR
- 4 - LEFT BODY WIRE HARNESS
- 5 - IOD CONNECTOR

- 7 - RIGHT BODY WIRE HARNESS
- 8 - SCREW
- 9 - BULKHEAD CONNECTOR
- 10 - JUNCTION BLOCK

connector receptacle on the lower rear surface of the Junction Block (JB) housing (Fig. 19). The JB is concealed above the molded plastic instrument panel fuse cover. Integral latches molded into the fuse cover secure it to the JB, the Body Control Module (BCM) and the 16-way data link connector tab of the instrument panel steering column support bracket. The fuse cover can be pulled downward to disengage the latches and provide service access to all of the fuses, relays and wire harness connectors of the JB. Refer to **Instrument Panel Fuse Cover** in the index of this service manual for the location of additional service information covering the fuse cover.

OPERATION

The term ignition-off draw identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. The IOD connector feeds the memory and sleep mode functions for some of the electronic modules in the vehicle

as well as various other accessories that require battery current when the ignition switch is in the Off position, including the clock.

The IOD connector can be used by the vehicle owner as a convenient means of reducing battery depletion when a vehicle is to be stored for periods not to exceed about twenty days (short-term storage). Simply disconnect the IOD connector from the JB receptacle. However, it must be remembered that disconnecting the IOD connector will not eliminate IOD, but only reduce this normal condition. When a vehicle will not be used for more than twenty days, but less than thirty days, remove the IOD fuse from the Power Distribution Center (PDC). If a vehicle will be stored for more than about thirty days, the battery negative cable should be disconnected to eliminate normal IOD; and, the battery should be tested and recharged at regular intervals during the vehicle storage period to prevent the battery from becoming discharged or damaged. Refer to **Ignition-Off Draw Fuse** and **Battery** in the index in this service manual for the location of additional service information covering the ignition-off draw fuse and the battery.

FUSE COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Pull down on the rear edge (nearest the rear of the vehicle) of the instrument panel fuse cover until the rear latches unsnap from the tabs on the lower junction block housing and the side latch unsnaps from the tab on the instrument panel steering column support bracket outboard of the 16-way data link connector (Fig. 20).

(3) Move the instrument panel fuse cover towards the front of the vehicle to disengage the front latches from the mounting slots in the lower housing of the body control module.

(4) Remove the fuse cover from under the instrument panel.

FUSE COVER (Continued)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the two front latches of the instrument panel fuse cover within the two locator channel formations on the bottom of the body control module housing (Fig. 21).

(2) While applying a slight upward pressure to the instrument panel fuse cover over the front latches, slowly slide the front latches through the locator channels toward the front of the vehicle until the latches exit the front of the locator channels. This will locate the front latches at the mounting slots in the lower housing of the body control module.

(3) Apply a slight rearward pressure on the instrument panel fuse cover to engage the front latches in

80b76f92

the mounting slots in the lower housing of the body control module.

(4) Swing the rear edge (nearest the rear of the vehicle) of the instrument panel fuse cover up toward the junction block.

(5) Press firmly upward on the instrument panel fuse cover over the rear latches until the latches snap into place over the tabs on the lower edge of the junction block housing.

(6) Press firmly upward on the 16-way data link connector cover formation of the instrument panel fuse cover until the side latch snaps into place over the tab on the outboard side of the instrument panel steering column support bracket.

(7) Reconnect the battery negative cable.

ENGINE - 4.0L

DESCRIPTION

The 4.0 Liter (242 CID) six-cylinder engine is an In-line, lightweight, overhead valve engine. This engine is designed for unleaded fuel.

The engine cylinder head has dual quench-type combustion chambers that create turbulence and fast burning of the air/fuel mixture. This results in better fuel economy.

The cylinders are numbered 1 through 6 from front to rear. The firing order is 1-5-3-6-2-4 (Fig. 1).

The crankshaft rotation is clockwise, when viewed from the front of the engine. The crankshaft rotates within seven main bearings. The camshaft rotates within four bearings.

80b770a2

Fig. 1 Engine Firing Order

ENGINE - 4.0L (Continued)

The engine Build Date Code is located on a machined surface on the right side of the cylinder block between the No.2 and No.3 cylinders (Fig. 2).

Fig. 2 Build Date Code Location

- 1 - YEAR
2 - MONTH
3 - DAY

The digits of the code identify:

- 1st Digit—The year (8 = 1998).
- 2nd & 3rd Digits—The month (01 - 12).

- 4th & 5th Digits—The engine type/fuel system/compression ratio (MX = A 4.0 Liter (242 CID) 8.7:1 compression ratio engine with a multi-point fuel injection system).

- 6th & 7th Digits—The day of engine build (01 - 31).

(1) **FOR EXAMPLE:** Code * 801MX12 * identifies a 4.0 Liter (242 CID) engine with a multi-point fuel injection system, 8.7:1 compression ratio and built on January 12, 1998.

DIAGNOSIS AND TESTING—ENGINE

DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Performance) or (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - Mechanical). Refer to FUEL SYSTEM for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE - 4.0L (Continued)

DIAGNOSIS AND TESTING - SERVICE DIAGNOSIS (PERFORMANCE)*ENGINE PERFORMANCE DIAGNOSIS CHART*

CONDITION	POSSIBLE CAUSES	CORRECTION
ENGINE WILL NOT CRANK	<ol style="list-style-type: none"> 1. Weak or dead battery 2. Corroded or loose battery connections 3. Faulty starter or related circuit(s) 4. DIAGNOSIS AND TESTING - SERVICE DIAGNOSIS (MECHANICAL)*ENGINE MECHANICAL DIAGNOSIS CHART*

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase 2. Thin or diluted oil 3. Low oil pressure 4. Dirt in tappets/lash adjusters 5. Bent push rod(s) 6. Worn rocker arms 7. Worn tappets/lash adjusters 8. Worn valve guides 9. Excessive runout of valve seats or valve faces	1. Check for correct oil level. Adjust oil level by draining or adding as needed 2. Change oil. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) 3. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) for engine oil pressure test/specifications 4. Clean/replace hydraulic tappets/lash adjusters 5. Install new push rods 6. Inspect oil supply to rocker arms and replace worn arms as needed 7. Install new hydraulic tappets/lash adjusters 8. Inspect all valve guides and replace as necessary 9. Grind valves and seats
CONNECTING ROD NOISE	1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive connecting rod bearing clearance	1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) engine oil pressure test/specifications 3. Change oil to correct viscosity. (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE) for correct procedure/engine oil specifications Measure bearings for correct clearance with plasti-gage. Repair as necessary

ENGINE - 4.0L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	5. Connecting rod journal out of round 6. Misaligned connecting rods	5. Replace crankshaft or grind journals 6. Replace bent connecting rods
MAIN BEARING NOISE	1. Insufficient oil supply 2. Low oil pressure 3. Thin or diluted oil 4. Excessive main bearing clearance 5. Excessive end play 6. Crankshaft main journal out of round or worn 7. Loose flywheel or torque converter	1. Check engine oil level. 2. Check engine oil level. If ok, Perform oil pressure test. (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING) 3. Change oil to correct viscosity. 4. Measure bearings for correct clearance. Repair as necessary 5. Check crankshaft thrust bearing for excessive wear on flanges 6. Grind journals or replace crankshaft 7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque
LOW OIL PRESSURE	1. Low oil level 2. Faulty oil pressure sending unit 3. Clogged oil filter 4. Worn oil pump 5. Thin or diluted oil 6. Excessive bearing clearance 7. Oil pump relief valve stuck 8. Oil pump suction tube loose, broken, bent or clogged 9. Oil pump cover warped or cracked	1. Check oil level and fill if necessary 2. Install new sending unit 3. Install new oil filter 4. Replace oil pump assembly. 5. Change oil to correct viscosity. 6. Measure bearings for correct clearance 7. Remove valve to inspect, clean and reinstall 8. Inspect suction tube and clean or replace if necessary 9. Install new oil pump
OIL LEAKS	1. Misaligned or deteriorated gaskets 2. Loose fastener, broken or porous metal part 3. Front or rear crankshaft oil seal leaking 4. Leaking oil gallery plug or cup plug	1. Replace gasket 2. Tighten, repair or replace the part 3. Replace seal 4. Remove and reseal threaded plug. Replace cup style plug
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. CCV System malfunction 2. Defective valve stem seal(s)	1. (Refer to 25 - EMISSIONS CONTROL/EVAPORATIVE EMISSIONS - DESCRIPTION) for correct operation 2. Repair or replace seal(s)

ENGINE - 4.0L (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Worn or broken piston rings	3. Hone cylinder bores. Install new rings
	4. Scuffed pistons/cylinder walls	4. Hone cylinder bores and replace pistons as required
	5. Carbon in oil control ring groove	5. Remove rings and de-carbon piston
	6. Worn valve guides	6. Inspect/replace valve guides as necessary
	7. Piston rings fitted too tightly in grooves	7. Remove rings and check ring end gap and side clearance. Replace if necessary

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise, the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(3) Secure the throttle in the wide-open position.

(4) Disconnect the ignition coil.

(5) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(6) Record the compression pressure on the third revolution. Continue the test for the remaining cylinders.

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket
- Any causes for combustion/compression pressure loss

WARNING: DO NOT REMOVE THE RADIATOR CAP WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM HOT COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the radiator cap.

Start and operate the engine until it attains normal operating temperature, then turn OFF the engine.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

Perform the test procedure on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe or oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART below

ENGINE - 4.0L (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

DIAGNOSIS AND TESTING—REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
- (4) If no leaks are detected, pressurized the crankcase as outlined in (Refer to 9 - ENGINE/LUBRICATION - DIAGNOSIS AND TESTING)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or

scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to the service Diagnosis—Mechanical, under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL), for proper replacement procedures.

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when

ENGINE - 4.0L (Continued)

exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier than using pre-cut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a

locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURES—HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

(1) Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(2) Disconnect the negative cable(s) from the battery.

(3) Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.

(4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.

(5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.

(6) Identify the fluid in the cylinders (coolant, fuel, oil, etc.).

(7) Be sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

ENGINE - 4.0L (Continued)

(10) Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(15) Connect the negative cable(s) to the battery.

(16) Start the engine and check for any leaks.

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 3).

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the cross-hatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-

J9209-12

Fig. 3 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 4).

9209-41

Fig. 4 CORE HOLE PLUG REMOVAL

- 1 - CYLINDER BLOCK
2 - REMOVE PLUG WITH PLIERS
3 - STRIKE HERE WITH HAMMER
4 - DRIFT PUNCH
5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

ENGINE - 4.0L (Continued)

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Mark the hinge locations on the hood panel for alignment reference during installation. Remove the engine compartment lamp. Remove the hood.
- (3) Remove the radiator drain cock and radiator cap to drain the coolant. DO NOT waste usable coolant. If the solution is clean, drain the coolant into a clean container for reuse.
- (4) Remove the upper radiator hose and coolant recovery hose.
- (5) Remove the lower radiator hose.
- (6) Remove upper radiator support retaining bolts and remove radiator support.
- (7) Remove the fan assembly from the water pump (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (8) Remove the fan shroud.
- (9) Disconnect the transmission fluid cooler lines (automatic transmission).
- (10) Discharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (11) Remove the service valves and cap the compressor ports.
- (12) Remove the radiator or radiator/condenser (if equipped with A/C).
- (13) Disconnect the heater hoses at the engine thermostat housing and water pump.
- (14) Disconnect the accelerator cable, transmission line pressure cable and speed control cable (if equipped) from the throttle body.
- (15) Remove cables from the bracket and secure out of the way.
- (16) Disconnect the body ground at the engine.
- (17) Disconnect the following connectors and secure their harness out of the way.
 - Power steering pressure switch
 - Coolant temperature sensor
 - Six (6) fuel injector connectors
 - Intake air temperature sensor
 - Throttle position sensor
 - Map sensor
 - Crankshaft position sensor

- Oxygen sensor
- Camshaft position sensor
- Generator connector and B+ terminal wire

(18) Disconnect the coil rail electrical connections and the oil pressure switch connector.

(19) Perform the fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(20) Disconnect the fuel supply line at the injector rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(21) Remove the fuel line bracket from the intake manifold.

(22) Remove the air cleaner assembly (Fig. 5).

(23) Disconnect the hoses from the fittings at the steering gear.

(24) Drain the pump reservoir.

(25) Cap the fittings on the hoses and steering gear to prevent foreign objects from entering the system.

J9309-7

Fig. 5 Air Cleaner Assembly

- 1 - POWER STEERING PUMP
2 - AIR CLEANER ASSEMBLY

- (26) Raise and support the vehicle.
- (27) Disconnect the wires from the engine starter motor solenoid.
- (28) Remove the engine starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (29) Disconnect the oxygen sensor from the exhaust pipe.

ENGINE - 4.0L (Continued)

- (30) Disconnect the exhaust pipe from the manifold.
- (31) Remove the exhaust pipe support.
- (32) Remove the bending brace (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCT SUPPORT - REMOVAL).
- (33) Remove the engine flywheel/converter housing access cover.
- (34) Mark the converter and drive plate location.
- (35) Remove the converter-to-drive plate bolts.
- (36) Remove the upper engine flywheel/converter housing bolts and loosen the bottom bolts.
- (37) Remove the engine mount cushion-to-engine compartment bracket bolts.
- (38) Lower the vehicle.
- (39) Attach a lifting device to the engine.
- (40) Raise the engine off the front supports.
- (41) Place a support or floor jack under the converter (or engine flywheel) housing.
- (42) Remove the remaining converter (or engine flywheel) housing bolts.
- (43) Lift the engine out of the engine compartment.

INSTALLATION

CAUTION: When installing the engine into a vehicle equipped with an automatic transmission, be careful not to damage the trigger wheel on the engine flywheel.

- (1) Attach a lifting device to the engine and lower the engine into the engine compartment. For easier installation, it may be necessary to remove the engine mount bracket as an aid in alignment of the engine to the transmission.
- (2) Align the transmission torque converter housing with the engine.
- (3) Loosely install the converter housing lower bolts and install the next higher bolt and nut on each side.
- (4) Tighten all 4 bolts finger tight.
- (5) Install the engine mount brackets (if removed).
- (6) Lower the engine and engine mount brackets onto the engine compartment cushions. Install the bolts and finger tighten the nuts.
- (7) Remove the engine lifting device.
- (8) Raise and support the vehicle.
- (9) Install the remaining engine flywheel/converter housing bolts. Tighten all bolts to 38 N·m (28 ft. lbs.) torque.
- (10) Install the converter-to-drive plate bolts.
- (11) Ensure the installation reference marks are aligned.
- (12) Install the engine flywheel/converter housing access cover.

- (13) Install the exhaust pipe support and tighten the screw.
- (14) Install the engine bending brace (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCT SUPPORT - INSTALLATION).
- (15) Tighten the engine mount-to-bracket bolts.
- (16) Connect the vehicle speed sensor wire connections and tighten the screws.
- (17) Connect the exhaust pipe to the manifold.
- (18) Install the engine starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).
- (19) Connect the wires to the engine starter motor solenoid.
- (20) Lower the vehicle.
- (21) Connect all the vacuum hoses and wire connectors identified during engine removal.
- (22) Remove protective caps from the power steering hoses.
- (23) Connect the hoses to the fittings at the steering gear. Tighten the nut to 52 N·m (38 ft. lbs.) torque.
- (24) Fill the pump reservoir with fluid.
- (25) Inspect the fuel supply line o-ring(s) and replace if necessary. Connect fuel supply line to injector rail and verify connection by pulling outward on the line.
- (26) Install the fuel line bracket to the intake manifold.
- (27) Connect the coil rail electrical connectors and oil pressure switch connector.
- (28) Connect the following electrical connectors:
 - Power steering pressure switch
 - Coolant temperature sensor
 - Six (6) fuel injector connectors
 - Intake air temperature sensor
 - Throttle position sensor
 - Map sensor
 - Crankshaft position sensor
 - Oxygen sensor
 - Camshaft position sensor
 - Generator connector and B+ terminal wire
- (29) Connect all previously removed vacuum hoses.
- (30) Connect the body ground strap.
- (31) Install the throttle, transmission line pressure, and speed control cables to their mounting bracket and connect them to the throttle body.
- (32) Connect the heater hoses at the engine thermostat housing and water pump.
- (33) Install the fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
- (34) Place the fan shroud in position over the fan.
- (35) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).
- (36) Connect the service valves to the A/C compressor ports, if equipped with A/C.

ENGINE - 4.0L (Continued)

(37) Charge the air conditioner system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(38) Connect the radiator hoses and automatic transmission fluid cooler pipes, if equipped.

(39) Install the fan shroud to the radiator or radiator/condenser (if equipped with A/C).

(40) Install upper radiator support.

(41) Connect the upper radiator hose and tighten the clamp.

(42) Connect the lower radiator hose and tighten the clamp.

(43) Fill crankcase with engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID CAPACITIES - SPECIFICATIONS) for correct capacities.

(44) Fill the cooling system with reusable coolant or new coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(45) Align the hood to the scribe marks. Install the hood.

(46) Install the air cleaner assembly.

(47) Install the battery and connect the battery cable.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(48) Start the engine, inspect for leaks and correct the fluid levels, as necessary.

SPECIFICATIONS

ENGINE - 4.0L

DESCRIPTION	SPECIFICATION
Engine Type	In-line 6 Cylinder
Bore and Stroke	98.4 x 86.69 mm (3.88 x 3.413 in.)
Displacement	4.0L (242 cu. in.)

AIR CLEANER ELEMENT

REMOVAL - 4.0L

- (1) Unlatch four clips retaining air cleaner cover to air cleaner housing (Fig. 6).
- (2) Lift cover up and position to the side.
- (3) Remove air cleaner element.

INSTALLATION - 4.0L

- (1) Clean inside of air cleaner housing before installing new element.
- (2) Install air cleaner element into housing.
- (3) Latch clips and clamp cover down to secure. Be sure air cleaner cover is properly seated to air cleaner housing.

AIR CLEANER HOUSING

REMOVAL - 4.0L

- (1) Disconnect air cleaner cover-to-air duct clamp (Fig. 6).
- (2) Disconnect air duct at housing.

AIR CLEANER HOUSING (Continued)

**Fig. 6 Air Cleaner Assembly —4.0L Engine**

- 1 - RESONATOR BOLTS
- 2 - CLAMPS
- 3 - AIR DUCT
- 4 - AIR CLEANER COVER
- 5 - CLIPS
- 6 - HOUSING
- 7 - HOUSING BOLTS (3)
- 8 - LOWER HOUSING NUTS (3)
- 9 - RESONATOR

(3) **Each of the 3 air cleaner housing mounting bolts is attached with 2 nuts (an upper nut and lower nut). DO NOT REMOVE BOLTS. To prevent stripping bolts, only remove lower nuts. The lower housing nuts are located under left front inner fender (Fig. 6).**

- (a) To gain access to lower nuts, raise vehicle.
- (b) Remove clips retaining rubber inner fender shield.
- (c) Pry back shield enough to gain access to lower nuts.
- (d) Remove 3 nuts.
- (e) Remove air cleaner assembly from vehicle.
- (4) If resonator is to be removed, disconnect breather tube at resonator, disconnect air duct clamp at resonator (Fig. 6) and remove 1 resonator mounting bolt. Remove resonator from throttle body by loosening clamp (Fig. 7).

80b89903

Fig. 7 RESONATOR CLAMP - 4.0L

- 1 - RESONATOR
- 2 - AIR DUCT
- 3 - CLAMP

INSTALLATION - 4.0L

(1) Position air cleaner assembly to body and install 3 nuts. Tighten nuts to 10 N·m (93 in. lbs.) torque. **To prevent excessive vibration transmitted through housing, the nuts must be properly torqued. Do not overtighten nuts.**

(2) If resonator was removed: Install resonator and bolts. Tighten bolts to 4 N·m (35 in. lbs.) torque. Tighten clamp at throttle body to 4 N·m (35 in. lbs.) torque.

- (3) Position fender liner and install clips.
- (4) Connect air duct at housing (Fig. 6).
- (5) Tighten air duct clamp.

CYLINDER HEAD**DESCRIPTION**

The cylinder head is made of cast iron containing twelve valves made of chrome plated heat resistant steel, valve stem seals, springs, retainers and keepers. The cylinder head and valve seats can be resurfaced for service purposes.

The valve guides are integral to the cylinder head. They are not replaceable. However, they are serviceable.

The cylinder head uses dual quench-type design combustion chambers which cause turbulence in the

CYLINDER HEAD (Continued)

cylinders allowing faster burning of the air/fuel mixture, resulting in better fuel economy (Fig. 8).

80a534a1

Fig. 8 Cylinder Head 4.0L Engine

- 1 - CYLINDER HEAD BOLTS
- 2 - CYLINDER HEAD GASKET
- 3 - CYLINDER HEAD

REMOVAL

NOTE: This procedure can be done with the engine in or out of the vehicle.

- (1) Disconnect the battery negative cable.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) Drain the coolant (Refer to 7 - COOLING - STANDARD PROCEDURE) and disconnect the hoses at the engine thermostat housing and the water pump inlet. DO NOT waste reusable coolant. If the solution is clean and is being drained only to service the engine or cooling system, drain the coolant into a clean container for reuse.

(3) Remove the air cleaner assembly (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(4) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(5) Remove the capscrews, bridge and pivot assemblies and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

(6) Remove the push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order as removed.**

(7) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(8) Remove the A/C compressor mounting bolts and secure the compressor to the side.

(9) Remove the power steering pump and bracket from the intake manifold and water pump. Set the pump and bracket aside. DO NOT disconnect the hoses.

(10) Perform the Fuel System Pressure Release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(11) Disconnect the fuel supply line at the fuel rail.

(12) Remove the intake and exhaust manifolds from the engine cylinder head (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(13) Remove the coil rail (Refer to 8 - ELECTRICAL/IGNITION CONTROL/COIL RAIL - REMOVAL).

(14) Remove spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).

(15) Disconnect the temperature sending unit wire connector.

(16) Remove the engine cylinder head bolts. Bolt No.14 cannot be removed until the head is moved forward (Fig. 9) . Pull bolt No.14 out as far as it will go and then suspend the bolt in this position (tape around the bolt).

(17) Remove the engine cylinder head and gasket (Fig. 9).

(18) If this was the first time the bolts were removed, put a paint dab on the top of the bolt. If the bolts have a paint dab on the top of the bolt or it isn't known if they were used before, discard the bolts.

(19) Stuff clean lint free shop towels into the cylinder bores.

NOTE: If the valves, springs, or seals are to be inspected/replaced at this time, (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE) for proper inspection procedures.

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and engine exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

CYLINDER HEAD (Continued)

80a534a1

Fig. 9 Engine Cylinder

- 1 - CYLINDER HEAD BOLTS
2 - CYLINDER HEAD GASKET
3 - CYLINDER HEAD

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces.

INSTALLATION

NOTE: This procedure can be done with the engine in or out of the vehicle.

The engine cylinder head gasket is a composition gasket. The gasket is to be installed DRY. **DO NOT use a gasket sealing compound on the gasket.**

If the engine cylinder head is to be replaced and the original valves used, measure the valve stem diameter. Only standard size valves can be used with a service replacement engine cylinder head unless the replacement head valve stem guide bores are reamed to accommodate oversize valve stems. Remove all carbon buildup and reface the valves.

(1) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.

(2) Position the engine cylinder head gasket (with the numbers facing up) using the alignment dowels in the cylinder block, to position the gasket.

CAUTION: Engine cylinder head bolts should be reused only once. Replace the head bolts if they were used before or if they have a paint dab on the top of the bolt.

(3) With bolt No.14 held in place (tape around bolt), install the engine cylinder head over the same dowels used to locate the gasket. Remove the tape from bolt No.14.

(4) Coat the threads of stud bolt No.11 with Loctite 592 sealant, or equivalent.

(5) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 10).

CAUTION: During the final tightening sequence, bolt No.11 will be tightened to a lower torque than the rest of the bolts. **DO NOT** overtighten bolt No.11.

(a) Tighten all bolts in sequence (1 through 14) to 30 N·m (22 ft. lbs.) torque.

(b) Tighten all bolts in sequence (1 through 14) to 61 N·m (45 ft. lbs.) torque.

(c) Check all bolts to verify they are set to 61 N·m (45 ft. lbs.) torque.

(d) Tighten bolts in sequence:

- Bolts 1 through 10 to 149 N·m (110 ft. lbs.) torque.

- Bolt 11 to 135 N·m (100 ft. lbs.) torque.

- Bolts 12 through 14 to 149 N·m (110 ft. lbs.) torque.

CYLINDER HEAD BOLTS

POSITION	DESCRIPTION
1,4,5,12,13	1/2 in.-13 BOLT
8,9	1/2 in.-13 BOLT WITH DOWEL POINT
2,3,6,7,10,11,14	1/2 in.-13 WITH 7/16 in.-14 STUD END
All bolts are 12 point drives for rocker cover clearance	

(e) Check all bolts in sequence to verify the correct torque.

(f) If not already done, clean and mark each bolt with a dab of paint after tightening. Should you encounter bolts which were painted in an earlier service operation, replace them.

**Fig. 10 Engine Cylinder Head Bolt Tightening Sequence**

CYLINDER HEAD (Continued)

(6) Install the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - INSTALLATION).

(7) Connect the temperature sending unit wire connector.

(8) Install the ignition coil rail (Refer to 8 - ELECTRICAL/IGNITION CONTROL/COIL RAIL - INSTALLATION).

(9) Install the intake and exhaust manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(10) Install the fuel line.

(11) Attach the power steering pump and bracket.

(12) Install the push rods, rocker arms, pivots and bridges in the order they were removed (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(13) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(14) Attach the air conditioner compressor mounting bracket to the engine cylinder head and block. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.

(15) Attach the air conditioning compressor to the bracket. Tighten the bolts to 27 N·m (20 ft. lbs.) torque.

CAUTION: The serpentine drive belt must be routed correctly. Incorrect routing can cause the water pump to turn in the opposite direction causing the engine to overheat.

(16) Install the serpentine drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(17) Install the air cleaner and ducting.

(18) Connect the hoses to the engine thermostat housing and fill the cooling system to the specified level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(19) The automatic transmission throttle linkage and cable must be adjusted after completing the engine cylinder head installation (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - ADJUSTMENTS).

(20) Install the temperature sending unit and connect the wire connector.

(21) If equipped with air conditioning, install A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION) and charge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(22) Connect negative cable to battery.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT

LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(23) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the engine thermostat opens. Add coolant, if required.

CYLINDER HEAD COVER(S)

DESCRIPTION

The cylinder head cover (Fig. 11) is made of stamped steel and incorporates the Crankcase Ventilation (CCV) Hoses and the oil fill opening.

80bcea5b

Fig. 11 Cylinder Head Cover

REMOVAL

The cylinder head cover is isolated from the cylinder head via grommets and a reusable molded rubber gasket. The grommet and limiter are retained in the cylinder head cover.

(1) Disconnect negative cable from battery.

(2) Disconnect the Crankcase Ventilation (CCV) vacuum hose from engine cylinder head cover.

(3) Disconnect the fresh air inlet hose from the engine cylinder head cover.

(4) Disconnect the accelerator, transmission, and speed (if equipped) control cables from the throttle body (Fig. 12).

(5) Remove the three bolts that fasten the control cable bracket to the intake manifold.

(6) Remove control cables from cylinder head cover clip.

(7) Position control cables and bracket away from cylinder head cover secure with tie straps.

(8) Remove the engine cylinder head cover mounting bolts.

(9) Remove the engine cylinder head cover and gasket.

CYLINDER HEAD COVER(S) (Continued)

**Fig. 12 Engine Cylinder Head Cover**

- 1 - TRANS CONTROL CABLE
- 2 - ACCELERATOR CABLE
- 3 - CONTROL CABLE BRACKET
- 4 - CYLINDER HEAD COVER

CLEANING

Remove any original sealer from the cover sealing surface of the engine cylinder head and clean the surface using a fabric cleaner.

Remove all residue from the sealing surface using a clean, dry cloth.

INSPECTION

Inspect the engine cylinder head cover for cracks. Replace the cover, if cracked.

The original dark grey gasket material should NOT be removed. If sections of the gasket material are missing or are compressed, replace the engine cylinder head cover. However, sections with minor damage such as small cracks, cuts or chips may be repaired with a hand held applicator. The new material must be smoothed over to maintain gasket height. Allow the gasket material to cure prior to engine cylinder head cover installation.

INSTALLATION

The cylinder head cover is isolated from the cylinder head via grommets and a reusable molded rubber gasket. The grommet and limiter are retained in the cylinder head cover.

(1) If a replacement cover is installed, transfer the CCV valve grommet and oil filler cap from the original cover to the replacement cover.

(2) Install cylinder head cover and gasket (Fig. 13). Tighten the mounting bolts to 10 N·m (85 in. lbs.) torque.

(3) Connect the CCV hoses.

**Fig. 13 Cylinder Head Cover Gasket Locator Pins at #8 & #9**

(4) Install control cables and bracket on intake manifold and tighten bolts to 8.7 N·m (77 in. lbs.) torque.

(5) Connect control cables to throttle body linkage.

(6) Snap control cables into cylinder head cover clip.

(7) Connect negative cable to battery.

INTAKE/EXHAUST VALVES & SEATS**DESCRIPTION**

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. All valves use three bead locks to promote valve rotation (Fig. 14).

STANDARD PROCEDURE - VALVE SERVICE**VALVE REFACING**

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.

(2) After refacing, a margin of at least 0.787 mm (0.031 inch) must remain (Fig. 15). If the margin is less than 0.787 mm (0.031 inch), the valve must be replaced.

VALVE SEAT REFACING

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.

(2) Use tapered stones to obtain the specified seat width when required.

**Fig. 16 Measurement of Valve Seat Runout**

1 - DIAL INDICATOR

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT**PREFERRED METHOD**

- (1) Remove the valve from the head.
- (2) Clean the valve stem guide bore with solvent and a bristle brush.
- (3) Insert a telescoping gauge into the valve stem guide bore approximately 9.525 mm (.375 inch) from the valve spring side of the head (Fig. 17).
- (4) Remove and measure telescoping gauge with a micrometer.
- (5) Repeat the measurement with contacts lengthwise to engine cylinder head.
- (6) Compare the crosswise to lengthwise measurements to determine out-of-roundness. If the measurements differ by more than 0.0635 mm (0.0025 in.), ream the guide bore to accommodate an oversize valve stem.
- (7) Compare the measured valve guide bore diameter with specifications (7.95-7.97 mm or 0.313-0.314 inch). If the measurement differs from specification by more than 0.076 mm (0.003 inch), ream the guide bore to accommodate an oversize valve stem.

ALTERNATIVE METHOD

- (1) Use a dial indicator to measure the lateral movement of the valve stem (stem-to-guide clearance). This must be done with the valve installed in its guide and just off the valve seat (Fig. 18).
- (2) Correct clearance is 0.025-0.0762 mm (0.001-0.003 inch). If indicated movement exceeds the specification ream the valve guide to accommodate an oversize valve stem.

INTAKE/EXHAUST VALVES & SEATS (Continued)

Fig. 17 Measurement of Valve Guide Bore Diameter

- 1 - GAUGE
- 2 - 9.525 MM (3/8 INCH)
- 3 - VALVE STEM GUIDE
- 4 - CYLINDER HEAD

NOTE: Valve seats must be ground after reaming the valve guides to ensure that the valve seat is concentric to the valve guide.

J9009-16

Fig. 18 Measurement of Lateral Movement Of Valve Stem

- 1 - DIAL INDICATOR

REMOVAL

NOTE: This procedure is done with the engine cylinder head removed from the block.

(1) Remove the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) from the cylinder block.

(2) Use Valve Spring Compressor Tool MD-998772A and compress each valve spring.

(3) Remove the valve locks, retainers, springs and valve stem oil seals. Discard the oil seals (Fig. 19).

(4) Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(5) Remove the valves, and place them in a rack in the same order as removed.

80b7704b

Fig. 19 Valve and Valve Components

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

INSTALLATION

NOTE: This procedure is done with the engine cylinder head removed from the block.

(1) Thoroughly clean the valve stems and the valve guide bores.

(2) Lightly lubricate the stem.

(3) Install the valve in the original valve guide bore.

(4) Install the replacement valve stem oil seals on the valve stems (Fig. 20). If the 0.381 mm (0.015 inch) oversize valve stems are used, oversize oil seals are required.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(5) Position the valve spring and retainer on the engine cylinder head and compress the valve spring with Valve Spring Compressor Tool MD-998772A.

(6) Install the valve locks and release the tool.

(7) Tap the valve spring from side to side with a hammer to ensure that the spring is properly seated at the engine cylinder head. Also tap the top of the retainer to seat the valve locks.

(8) Install the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

Fig. 20 Valve and Valve Components

ROCKER ARM / ADJUSTER ASSEMBLY

DESCRIPTION

The rocker arms are made of stamped steel and have a operational ratio of 1.6:1 (Fig. 21).

OPERATION

When the push rods are forced upward by the camshaft lobes the push rod presses upward on the rocker arms, the rocker arms pivot, forcing downward pressure on the valves forcing the valves to move downward and off from their seats.

J8909-8

Fig. 21 Rocker Arms—Typical

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

REMOVAL

NOTE: This procedure can be done with the engine in or out of the vehicle.

(1) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Check for rocker arm bridges which are causing misalignment of the rocker arm to valve tip area.

(3) Remove the capscrews at each bridge and pivot assembly (Fig. 22). Alternately loosen the capscrews one turn at a time to avoid damaging the bridges.

(4) Remove the bridges, pivots and corresponding pairs of rocker arms (Fig. 22). Place them on a bench in the same order as removed.

(5) Remove the push rods and place them on a bench in the same order as removed.

CLEANING

Clean all the components with cleaning solvent.

Use compressed air to blow out the oil passages in the rocker arms and push rods.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

J8909-8

Fig. 22 Rocker Arm

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.

Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.

Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.

Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.

A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.

INSTALLATION

NOTE: This procedure can be done with the engine in or out of the vehicle.

(1) Lubricate the ball ends of the push rods with Mopar® Engine Oil Supplement, or equivalent and install push rods in their original locations. Ensure that the bottom end of each push rod is centered in the tappet plunger cap seat.

(2) Using Mopar® Engine Oil Supplement, or equivalent, lubricate the area of the rocker arm that the pivot contacts. Install rocker arms, pivots and bridge above each cylinder in their originally position (Fig. 23).

(3) Loosely install the capscrews through each bridge.

(4) At each bridge, tighten the capscrews alternately, one turn at a time, to avoid damaging the bridge. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(5) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

J8909-8

Fig. 23 Rocker Arm

- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

VALVE SPRINGS

DESCRIPTION

The valve springs (Fig. 25) are made of high strength silicon chrome spring steel. The springs are common for both intake and exhaust valves.

STANDARD PROCEDURE - VALVE SPRING TENSION TEST

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

Use a universal Valve Spring Tester and a torque wrench to test each valve spring for the specified tension value (Fig. 26).

Replace valve springs that are not within specifications.

9509-79

Fig. 26 Valve Spring Tester

- 1 - TORQUE WRENCH
- 2 - VALVE SPRING TESTER

REMOVAL

NOTE: This procedure can be done with the engine cylinder head installed on the block.

VALVE SPRINGS (Continued)

Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.

(1) Remove the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Remove cap screws, bridge and pivot assemblies and rocker arms (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL) for access to each valve spring to be removed.

(3) Remove push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order and position as removed.**

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Remove the spark plug(s) adjacent to the cylinder(s) below the valve springs to be removed.

(6) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats. For vehicles equipped with an air conditioner, use a flexible air adaptor when servicing the No.1 cylinder.

(7) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool MD-998772A to compress the spring and remove the locks (Fig. 27).

(8) Remove valve spring and retainer (Fig. 27).

(9) Remove valve stem oil seals (Fig. 27). Note the valve seals are different for intake and exhaust valves. The top of each seal is marked either INT (intake/black in color) or EXH (exhaust/brown in color). DO NOT mix the seals.

INSTALLATION

NOTE: This procedure can be done with the engine cylinder head installed on the block.

CAUTION: Install oil seals carefully to prevent damage from the sharp edges of the valve spring lock groove.

(1) Lightly push the valve seal over the valve stem and valve guide boss. Be sure the seal is completely seated on the valve guide boss.

(2) Install valve spring and retainer (Fig. 28).

(3) Compress the valve spring with Valve Spring Compressor Tool MD-998772A and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that

80b7704b

Fig. 27 Valve and Valve Components

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

the spring is seated properly on the engine cylinder head.

(4) Release air pressure and disconnect the air hose. Remove the adaptor from the spark plug hole and install the spark plug.

(5) Repeat the procedures for each remaining valve spring to be removed.

(6) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

(7) Install the rocker arms, pivots and bridge (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION) at their original location.

(8) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

ENGINE BLOCK

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.

ENGINE BLOCK (Continued)

80b7704b

Fig. 28 Valve and Valve

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

• The feed holes for the crankshaft main bearings.
Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter (Fig. 29). To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

9509-27

Fig. 29 Cylinder Bore Measurement

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder must be bored and then honed to accept an oversize piston. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CAMSHAFT & BEARINGS**DESCRIPTION**

The camshaft is made of gray cast iron with twelve machined lobes and four bearing journals (Fig. 30). When the camshaft rotates the lobes actuate the tappets and push rods, forcing upward on the rocker arms which applies downward force on the valves.

REMOVAL - CAMSHAFT BEARINGS

The camshaft rotates within four steel-shelled, babbitt-lined bearings that are pressed into the cylinder block and then line reamed. The camshaft bearing bores and bearing diameters are not the same size. They are stepped down in 0.254 mm (0.010 inch) increments from the front bearing (largest) to the rear bearing (smallest). This permits easier removal and installation of the camshaft. The camshaft bearings are pressure lubricated. Camshaft end play is maintained by the thrust plate.

CAMSHAFT & BEARINGS (Continued)

80bfe13b

Fig. 30 Camshaft—Typical

- 1 - CAMSHAFT
2 - LOBES
3 - BEARING JOURNAL

(1) Remove the camshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CAMSHAFT & BEARINGS (IN BLOCK) - REMOVAL).

NOTE: It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

(2) Using Special tool 8544 Camshaft Bushing Remover Installer, remove the camshaft bearings.

REMOVAL - CAMSHAFT

WARNING: THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. RELEASE THE PRESSURE BEFORE REMOVING THE DRAIN COCK, CAP AND DRAIN PLUGS.

- (1) Disconnect negative cable from battery.
- (2) Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL) and condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL), if equipped with A/C.
- (4) Remove the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(5) Remove the rocker arms, bridges and pivots (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).

(6) Remove the push rods.

(7) Remove the engine cylinder head and gasket (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

(8) Remove the hydraulic valve tappets from the engine cylinder block (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - REMOVAL).

(9) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(10) Remove the timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(11) Rotate the crankshaft until the crankshaft sprocket timing mark is aligned on centerline with the camshaft sprocket timing mark (Fig. 32).

(12) Remove the timing chain and sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(13) Remove the front bumper and/or grille, as required.

(14) Remove the two thrust plate retaining screws, thrust plate and camshaft (Fig. 31).

80bfe168

Fig. 31 Camshaft Removal

- 1 - CAMSHAFT
2 - CRANKSHAFT

INSPECTION - CAMSHAFT BEARINGS

- (1) Inspect the bearing journals for uneven wear pattern or finish.

CAMSHAFT & BEARINGS (Continued)

80bfe0fa

Fig. 32 Crankshaft / Camshaft Sprocket Timing Mark Alignment

- 1 - CAMSHAFT SPROCKET
- 2 - TIMING MARKS
- 3 - CRANKSHAFT SPROCKET

(2) Inspect the bearings for wear.

INSPECTION - CAMSHAFT

- (1) Inspect the cam lobes for wear.
- (2) Inspect the camshaft position sensor drive gear for wear.
- (3) If the camshaft appears to have been rubbing against the thrust washer, examine the oil pressure relief holes in the rear cam journal. The oil pressure relief holes must be free of debris.

INSTALLATION - CAMSHAFT BEARINGS

CAUTION: Make sure outside diameter of number 1 bearing is clean. Make sure that the bearing is properly installed in the engine block, align the oil hole in the bearing with the oil gallery in the bearing bore. Failure to do so will cause inadequate oil supply for the sprockets and timing chain.

- (1) Using recommended special tool 8544 Camshaft Bearing Remover/Installer, install new camshaft bearings.

INSTALLATION - CAMSHAFT

- (1) Lubricate the camshaft with Mopar® Engine Oil Supplement, or equivalent.

(2) Carefully install the camshaft to prevent damage to the camshaft bearings.

(3) Position thrust plate and install retaining screws. Tighten screws to 24 N·m (18 ft. lbs.).

(4) Lubricate the camshaft with Mopar® engine oil supplement, or equivalent.

(5) Install the camshaft sprocket, crankshaft sprocket and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(6) Tighten the camshaft sprocket bolt and washer to 68 N·m (50 ft. lbs.).

(7) To verify correct installation of the timing chain, turn the crankshaft two full revolutions then position the camshaft sprocket timing mark as shown in (Fig. 33).

80bfe0fa

Fig. 33 Crankshaft / Camshaft Chain Drive Installation—Typical

- 1 - CAMSHAFT SPROCKET
- 2 - TIMING MARKS
- 3 - CRANKSHAFT SPROCKET

(8) Install the timing case cover with a replacement oil seal (Fig. 34). (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(9) Install the vibration damper (Fig. 34) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(10) Install the hydraulic valve tappets (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).

(11) Install the cylinder head gasket with the numbers facing up.

CAMSHAFT & BEARINGS (Continued)

80abd2b1

Fig. 34 Timing Case Cover Components

- 2 - OIL SLINGER
- 3 - CRANKSHAFT OIL SEAL
- 4 - VIBRATION DAMPER PULLEY

(12) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(13) Install the push rods.

(14) Install the rocker arms and pivot and bridge assemblies (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).

(15) Install the engine cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(16) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

NOTE: During installation, lubricate the hydraulic valve tappets and all valve components with Mopar® Engine Oil Supplement, or equivalent. The Mopar® Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(17) Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(18) Check the ignition timing and adjust as necessary.

(19) Install the grille and bumper, if removed.

(20) Connect negative cable to battery.

CONNECTING ROD BEARINGS

STANDARD PROCEDURES - FITTING CONNECTING ROD BEARINGS

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 35) (Fig. 36). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 37). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

J8909-127

Fig. 35 Connecting Rod Bearing Inspection

- 5 - LOWER BEARING HALF

J8909-128

Fig. 36 Locking Tab Inspection

- 1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

CONNECTING ROD BEARINGS (Continued)

J8909-129

Fig. 37 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

BEARING-TO-JOURNAL CLEARANCE

- (1) Wipe the oil from the connecting rod journal.
- (2) Use short rubber hose sections over rod bolts during installation.
- (3) Lubricate the upper bearing insert and install in connecting rod.
- (4) Use piston ring compressor to install the rod and piston assemblies. The oil squirt holes in the rods must face the camshaft. The arrow on the piston crown should point to the front of the engine (Fig. 38). Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

J9009-41

Fig. 38 Rod and Piston Assembly Installation

- (5) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

- (6) Install bearing cap and connecting rod on the journal and tighten nuts to 45 N·m (33 ft. lbs.)

torque. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

- (7) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 39). **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

J9009-42

Fig. 39 Measuring Bearing Clearance with Plastigage

- 1 - PLASTIGAGE SCALE
- 2 - COMPRESSED PLASTIGAGE

- (8) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

- (9) If bearing-to-journal clearance exceeds the specification, install a pair of 0.0254 mm (0.001 inch) undersize bearing inserts. All the odd size inserts must be on the bottom. The sizes of the service replacement bearing inserts are stamped on the backs of the inserts. Measure the clearance as described in the previous steps.

- (10) The clearance is measured with a pair of 0.0254 mm (0.001 inch) undersize bearing inserts installed. This will determine if two 0.0254 mm (0.001 inch) undersize inserts or another combination is needed to provide the correct clearance. Refer to CONNECTING ROD BEARING FITTING CHART.

CONNECTING ROD BEARINGS (Continued)

CONNECTING ROD BEARING FITTING CHART

CRANKSHAFT JOURNAL		CORRESPONDING ROD BEARING INSERT	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	53.2257 - 53.2079 mm (2.0955 - 2.0948 in.)	Yellow - Standard	Yellow - Standard
Orange	53.2079 - 53.1901 mm (2.0948 - 2.0941 in.) 0.0178 mm (0.0007 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)
Blue	53.1901 - 53.1724 mm (2.0941 - 2.0934 in.) 0.0356 mm (0.0014 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Blue - Undersize 0.025 mm (0.001 in.)
Red	52.9717 - 52.9539 mm (2.0855 - 2.0848 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

(11) **FOR EXAMPLE:** If the initial clearance was 0.0762 mm (0.003 inch), 0.025 mm (0.001 inch) undersize inserts would reduce the clearance by 0.025 mm (0.001 inch). The clearance would be 0.002 inch and within specification. A 0.051 mm (0.002 inch) undersize insert would reduce the initial clearance an additional 0.013 mm (0.0005 inch). The clearance would then be 0.038 mm (0.0015 inch).

(12) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(13) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 45 N·m (33 ft. lbs.) torque.

SIDE CLEARANCE MEASUREMENT

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 40). (Refer to 9 - ENGINE - SPECIFICATIONS). Replace the connecting rod if the side clearance is not within specification.

Fig. 40 Checking Connecting Rod Side Clearance - Typical

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a crosshaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by seven select main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The select fit main bearing markings are located on the crankshaft counter weights. The crankshaft rear oil seal is a two piece design. The front oil seal is a one piece design retained in the timing chain cover (Fig. 41).

80ba7a6b

Fig. 41 Crankshaft with Select Fit Marking Location

- 1 - 1/4" LETTERS
2 - (ROD)
3 - (MAIN)

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE - FITTING CRANKSHAFT MAIN BEARINGS

FITTING BEARINGS (CRANKSHAFT INSTALLED)

The main bearing caps, numbered (front to rear) from 1 through 7 have an arrow to indicate the forward position. The upper main bearing inserts are grooved to provide oil channels while the lower inserts are smooth.

Each bearing insert pair is selectively fitted to its respective journal to obtain the specified operating clearance. In production, the select fit is obtained by using various-sized color-coded bearing insert pairs as listed in the Main Bearing Fitting Chart. The bearing color code appears on the edge of the insert. **The size is not stamped on bearing inserts used for engine production.**

The main bearing journal size (diameter) is identified by a color-coded paint mark (Fig. 42) on the adjacent cheek or counterweight towards the rear of the crankshaft (flange end). The rear main journal, is identified by a color-coded paint mark on the crankshaft rear flange.

When required, upper and lower bearing inserts of different sizes may be used as a pair. A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce the clearance by 0.013 mm (0.0005 inch). **Never use a pair of bearing inserts with greater than a 0.025 mm (0.001 inch) difference in size. Refer to the Bearing Insert Pair Chart.**

NOTE: When replacing inserts, the odd size inserts must be either all on the top (in cylinder block) or all on the bottom (in main bearing cap).

Once the bearings have been properly fitted, proceed to .

BEARING-TO-JOURNAL CLEARANCE (CRANKSHAFT INSTALLED)

When using Plastigage, check only one bearing clearance at a time.

Install the grooved main bearings into the cylinder block and the non-grooved bearings into the bearing caps.

Install the crankshaft into the upper bearings dry.

Place a strip of Plastigage across full width of the crankshaft journal to be checked.

Install the bearing cap and tighten the bolts to 108 N·m (80 ft. lbs.) torque.

NOTE: DO NOT rotate the crankshaft. This will cause the Plastigage to shift, resulting in an inaccurate reading. Plastigage must not be permitted to crumble. If brittle, obtain fresh stock.

Remove the bearing cap. Determine the amount of clearance by measuring the width of the compressed Plastigage with the scale on the Plastigage envelope (Fig. 43). (Refer to 9 - ENGINE - SPECIFICATIONS) for the proper clearance.

Plastigage should indicate the same clearance across the entire width of the insert. If clearance varies, it may indicate a tapered journal or foreign material trapped behind the insert.

If the specified clearance is indicated and there are no abnormal wear patterns, replacement of the bearing inserts is not necessary. Remove the Plastigage from the crankshaft journal and bearing insert. Proceed to (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - INSTALLATION).

CRANKSHAFT MAIN BEARINGS (Continued)

80a9f121

Fig. 42 Crankshaft Journal Size Paint I.D. Location

3 - NO. 1 CONNECTING ROD JOURNAL SIZE PAINT MARK

4 - NO. 1 MAIN JOURNAL SIZE PAINT MARK

**Fig. 43 Measuring Bearing Clearance with Plastigage**

1 - PLASTIGAGE SCALE

2 - COMPRESSED PLASTIGAGE

If the clearance exceeds specification, install a pair of 0.025 mm (0.001 inch) undersize bearing inserts and measure the clearance as described in the previous steps.

The clearance indicate with the 0.025 mm (0.001 inch) undersize insert pair installed will determine if this insert size or some other combination will provide the specified clearance. **FOR EXAMPLE:** If the clearance was 0.0762 mm (0.003 inch) originally, a pair of 0.0254 mm (0.001 inch) undersize inserts

would reduce the clearance by 0.0254 mm (0.001 inch). The clearance would then be 0.0508 mm (0.002 inch) and within the specification. A 0.051 mm (0.002 inch) undersize bearing insert and a 0.0254 mm (0.001 inch) undersize insert would reduce the original clearance an additional 0.0127 mm (0.0005 inch). The clearance would then be 0.0381 mm (0.0015 inch).

CAUTION: Never use a pair of inserts that differ more than one bearing size as a pair.

FOR EXAMPLE: DO NOT use a standard size upper insert and a 0.051 mm (0.002 inch) undersize lower insert.

If the clearance exceeds specification using a pair of 0.051 mm (0.002 inch) undersize bearing inserts, measure crankshaft journal diameter with a micrometer. If the journal diameter is correct, the crankshaft bore in the cylinder block may be misaligned, which requires cylinder block replacement or machining to true bore.

Replace the crankshaft or grind to accept the appropriate undersize bearing inserts if:

- Journal diameters 1 through 6 are less than 63.4517 mm (2.4981 inches)
- Journal 7 diameter is less than 63.4365 mm (2.4975 inches).

Once the proper clearances have been obtained, proceed to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - INSTALLATION).

CRANKSHAFT MAIN BEARINGS (Continued)

JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Remove the crankshaft from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper and out of round is 0.013 mm (0.0005 inch). Compare the measured diameter with the journal diameter specification **MAIN BEARING FITTING CHART**. Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block.

MAIN BEARING FITTING CHART

**Fig. 44 Main Bearing Caps and Brace.**

- 1 - BLOCK
2 - MAIN BEARING CAP BRACE

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the spark plugs (Refer to 8 - ELECTRICAL/IGNITION CONTROL/SPARK PLUG - REMOVAL).
- (3) Raise the vehicle.
- (4) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL) and oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
- (5) Remove main bearing cap brace (Fig. 44).
- (6) Remove only one main bearing cap and lower insert at a time (Fig. 45).
- (7) Remove the lower insert from the bearing cap.
- (8) Remove the upper insert by LOOSENING (DO NOT REMOVE) all of the other bearing caps. Now insert a small cotter pin tool in the crankshaft journal oil hole. Bend the cotter pin as illustrated to fabricate the tool (Fig. 46). With the cotter pin tool in place, rotate the crankshaft so that the upper bearing insert will rotate in the direction of its locking tab. Because there is no hole in the No.3 main journal, use a tongue depressor or similar soft-faced tool to remove the bearing insert (Fig. 46). After moving the insert approximately 25 mm (1 inch), it can be removed by applying pressure under the tab.
- (9) Using the same procedure described above, remove the remaining bearing inserts one at a time for inspection.

**Fig. 45 Removing Main Bearing Caps and Lower Inserts**

- 1 - CONNECTING ROD JOURNAL
2 - MAIN BEARING CAPS

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert

CRANKSHAFT MAIN BEARINGS (Continued)

**Fig. 46 Removing Upper Inserts**

- 1 - COTTER PIN
- 2 - BEARING INSERT
- 3 - TONGUE DEPRESSOR

wear patterns are illustrated (Fig. 47). In general the lower bearing half will have a heavier wear pattern.

**Fig. 47 Main Bearing Wear Patterns**

- 1 - UPPER INSERT
- 2 - NO WEAR IN THIS AREA
- 3 - LOW AREA IN BEARING LINING
- 4 - LOWER INSERT

NOTE: If any of the crankshaft journals are scored, remove the engine for crankshaft repair.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

INSTALLATION

(1) Lubricate the bearing surface of each insert with engine oil.

(2) Loosen all the main bearing caps. Install the main bearing upper inserts.

(3) Install the lower bearing inserts into the main bearing caps.

(4) On the rear main cap, apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 48). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(5) Apply Mopar® Gasket Maker on the rear bearing cap. The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

**Fig. 48 Location of Sealer**

- 1 - DOWEL
- 2 - SEALER LOCATIONS
- 3 - CYLINDER BLOCK
- 4 - HALFWAY BETWEEN
- 5 - REAR FACE OF CYLINDER BLOCK
- 6 - 3mm (0.125 in.)

(6) Install the main bearing cap(s) and lower insert(s).

(7) Tighten the bolts of caps 1, 2, 4, 5, 6, and 7 to 54 N·m (40 ft. lbs.) torque. Now tighten these bolts to 95 N·m (70 ft. lbs.) torque. Finally, tighten these bolts to 108 N·m (80 ft. lbs.) torque.

CRANKSHAFT MAIN BEARINGS (Continued)

(8) Push the crankshaft forward and backward. Load the crankshaft front or rear and tighten cap bolt No.3 to 54 N·m (40 ft. lbs.) torque. Then tighten to 95 N·m (70 ft. lbs.) torque and finally tighten to 108 N·m (80 ft. lbs.) torque.

(9) Rotate the crankshaft after tightening each main bearing cap to ensure the crankshaft rotates freely.

(10) Check crankshaft end play. Crankshaft end play is controlled by the thrust bearing which is flange and installed at the No.2 main bearing position.

(a) Attach a magnetic base dial indicator to the cylinder block at either the front or rear of the engine.

(b) Position the dial indicator rod so that it is parallel to the center line of the crankshaft.

(c) Pry the crankshaft forward, position the dial indicator to zero.

(d) Pry the crankshaft forward and backward. Note the dial indicator readings. End play is the difference between the high and low measurements (Fig. 49). Correct end play is 0.038-0.165 mm (0.0015-0.0065 inch). The desired specifications are 0.051-0.064 mm (0.002-0.0025 inch).

(e) If end play is not within specification, inspect crankshaft thrust faces for wear. If no wear is apparent, replace the thrust bearing and measure end play. If end play is still not within specification, replace the crankshaft.

Fig. 49 Crankshaft End Play Measurement

- 1 - DIAL INDICATOR
2 - CRANKSHAFT

(11) If the crankshaft was removed, install the crankshaft into the cylinder block.

(12) Install main bearing cap brace tighten nuts to 47 N·m (35 ft. lbs.) torque.

(13) Install oil pump assy. and tighten attaching bolts to 23 N·m (17 ft. lbs.)

(14) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(15) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(16) Lower the vehicle.

(17) Install the spark plugs. Tighten the plugs to 37 N·m (27 ft. lbs.) torque.

(18) Fill the oil pan with engine oil to the full mark on the dipstick level.

(19) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

This procedure is done with the timing case cover installed.

(1) Disconnect negative cable from battery.

(2) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(3) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(4) Remove the radiator shroud.

(5) Carefully remove the oil seal. Make sure seal bore is clean.

INSTALLATION

This procedure is done with the timing case cover installed.

(1) Position the replacement oil seal on Timing Case Cover Alignment and Seal Installation Tool 6139 with seal open end facing inward. Apply a light film of Perfect Seal, or equivalent, on the outside diameter of the seal. Lightly coat the crankshaft with engine oil.

(2) Position the tool and seal over the end of the crankshaft and insert a draw screw tool into Seal Installation Tool 6139 (Fig. 50). Tighten the nut against the tool until it contacts the cover.

(3) Remove the tools. Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(4) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(5) Install the serpentine belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

CRANKSHAFT OIL SEAL - FRONT (Continued)

**Fig. 50 Timing Case Cover Oil Seal Installation**

- 1 - SEAL INSTALLATION TOOL
2 - DRAW SCREW TOOL

- (6) Install the radiator shroud.
(7) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

The crankshaft rear main bearing oil seal consists of two half pieces of viton with a single lip that effectively seals the rear of the crankshaft. Replace the upper and lower seal halves as a unit to ensure leak-free operation.

- (1) Remove transmission inspection cover.
- (2) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
- (3) Remove main bearing cap brace.
- (4) Remove rear main bearing cap (No.7).
- (5) Push upper seal out of the groove. Ensure that the crankshaft and seal groove are not damaged.
- (6) Remove lower half of the seal from the bearing cap.

INSTALLATION

The crankshaft rear main bearing oil seal consists of two half pieces of viton with a single lip that effectively seals the rear of the crankshaft. Replace the upper and lower seal halves as a unit to ensure leak-free operation.

- (1) Wipe the seal surface area of the crankshaft until it is clean.
- (2) Apply a thin coat of engine oil.
- (3) Coat lip of the seal with engine oil.

(4) Carefully position the upper seal into the groove in the cylinder block. The lip of the seal faces toward the front of the engine.

(5) Apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 51). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(6) Apply Mopar® Gasket Maker on the rear bearing cap (Fig. 51). The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

(7) Position the lower seal into the bearing cap recess and seat it firmly. Be sure the seal is flush with the cylinder block pan rail.

(8) Coat the outer curved surface of the lower seal with soap and the lip of the seal with engine oil.

80bfe13c

Fig. 51 Location of Sealer

- 1 - DOWEL
2 - SEALER LOCATIONS
3 - CYLINDER BLOCK
4 - HALFWAY BETWEEN
5 - REAR FACE OF CYLINDER BLOCK
6 - 3mm (0.125 in.)

(9) Install the rear main bearing cap. DO NOT strike the cap more than twice for proper engagement.

(10) Tighten all main bearing bolts to 108 N·m (80 ft. lbs.) torque.

(11) Install the main bearing cap brace. Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan gasket and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

CRANKSHAFT OIL SEAL - REAR (Continued)

(13) Apply Mopar® Silicone Rubber Adhesive Sealant on cylinder block to rear main bearing cap corners and cylinder block to front cover joints (four places) (Fig. 52)

Fig. 52 Oil Pan

1 - SEALER LOCATIONS

(14) Install transmission inspection cover.

HYDRAULIC LIFTERS

DESCRIPTION

Valve lash is controlled by hydraulic tappets located inside the cylinder block, in tappet bores above the camshaft.

REMOVAL

NOTE: Retain all the components in the same order as removed.

(1) Remove the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) .

(2) Remove the push rods.

(3) Remove the tappets through the push rod openings in the cylinder block with a Hydraulic Valve Tappet Removal/Installation Tool (Fig. 53).

CLEANING

Clean each tappet assembly in cleaning solvent to remove all varnish, gum and sludge deposits.

INSPECTION

Inspect for indications of scuffing on the side and base of each tappet body.

Inspect each tappet base for concave wear with a straightedge positioned across the base. If the base is concave, the corresponding lobe on the camshaft is also worn. Replace the camshaft and tappets.

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 54).

Fig. 53 HYDRAULIC VALVE TAPPET REMOVAL - 4.0L

1 - HYDRAULIC TAPPET REMOVAL TOOL
2 - CYLINDER BLOCK

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

INSTALLATION

Retain all the components in the same order as removed.

It is not necessary to charge the tappets with engine oil. They will charge themselves within a very short period of engine operation.

Fig. 54 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

(1) Dip each tappet in Mopar® Engine Oil Supplement, or equivalent.

(2) Use Hydraulic Valve Tappet Removal/Installation Tool to install each tappet in the same bore from where it was originally removed.

(3) Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

(4) Install the push rods in their original locations.

(5) Install the rocker arms and bridge and pivot assemblies at their original locations. Loosely install the capscrews at each bridge.

(6) Tighten the capscrews alternately, one turn at a time, to avoid damaging the bridges. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(7) Pour the remaining Mopar® Engine Oil Supplement, or equivalent over the entire valve actuating assembly. The Mopar® Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1 609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(8) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

PISTON & CONNECTING ROD

DESCRIPTION

The pistons (Fig. 55) are made of a high strength aluminum alloy, the piston skirts are coated with a solid lubricant (Molykote) to reduce friction and pro-

vide scuff resistance. The connecting rods are made of cast iron.

Fig. 55 Piston and Connecting Rod Assembly

STANDARD PROCEDURE - PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 49.5 mm (1-15/16 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 57).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. **The coated piston connecting rod assembly can be used to service previous built engines and MUST be replaced as complete sets.** Tin coated pistons should not be used as replacements for coated pistons.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 56). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

- (1) Remove the engine cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
- (2) Remove the rocker arms, bridges and pivots.
- (3) Remove the push rods.
- (4) Remove the engine cylinder head. (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- (5) Position the pistons one at a time near the bottom of the stroke. Use a ridge reamer to remove the ridge from the top end of the cylinder walls. Use a protective cloth to collect the cuttings.
- (6) Raise the vehicle.
- (7) Drain the engine oil.
- (8) Remove the oil pan and gasket. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (9) Remove main bearing cap brace (Fig. 58).

- 2 - MAIN BEARING CAP BRACE

- (10) Remove the connecting rod bearing caps and inserts. Mark the caps and rods with the cylinder bore location. The connecting rods and caps are stamped with a two letter combination (Fig. 59).

PISTON & CONNECTING ROD (Continued)

80a534e5

Fig. 59 Stamped Connecting Rods and Caps

- 1 - CONNECTING ROD CAP
2 - CONNECTING ROD

(11) Lower the vehicle until it is about 2 feet from the floor.

CAUTION: Ensure that the connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose, slipped over the rod bolts will provide protection during removal.

(12) Have an assistant push the piston and connecting rod assemblies up and through the top of the cylinder bores (Fig. 60).

INSTALLATION

(1) Clean the cylinder bores thoroughly. Apply a light film of clean engine oil to the bores with a clean lint-free cloth.

(2) Install the piston rings on the pistons if removed (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).

(3) Lubricate the piston and rings with clean engine oil.

CAUTION: Ensure that connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose slipped over the connecting rod bolts will provide protection during installation.

(4) Use a piston ring compressor to install the connecting rod and piston assemblies through the top of the cylinder bores (Fig. 61).

(5) Ensure the arrow on the piston top points to the front of the engine (Fig. 61).

(6) Raise the vehicle.

(7) Each bearing insert is fitted to its respective journal to obtain the specified clearance between the bearing and the journal. In production, the select fit

J9509-84

Fig. 60 Removal of Connecting Rod and Piston Assembly

- 1 - PISTON
2 - CONNECTING ROD
3 - BLOCK

J9009-41

Fig. 61 Rod and Piston Assembly Installation

is obtained by using various-sized, color-coded bearing inserts as listed in the Connecting Rod Bearing Fitting Chart. The color code appears on the edge of the bearing insert. The size is not stamped on inserts used for production of engines.

(8) The rod journal is identified during the engine production by a color-coded paint mark on the adjacent cheek or counterweight toward the flange (rear) end of the crankshaft. The color codes used to indicate journal sizes are listed in the Connecting Rod Bearing Fitting Chart.

(9) When required, upper and lower bearing inserts of different sizes may be used as a pair (refer

PISTON & CONNECTING ROD (Continued)

to Connecting Rod Bearing Fitting Chart). A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce clearance 0.013 mm (0.0005 inch).

CAUTION: DO NOT intermix bearing caps. Each connecting rod and bearing cap are stamped with the cylinder number. The stamp is located on a machined surface adjacent to the oil squirt hole that faces the camshaft side of the cylinder block.

(10) Install the connecting rod bearing caps and inserts in the same positions as removed.

CAUTION: Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

(11) Install main bearing cap brace (Fig. 58). Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan and gasket (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(13) Lower the vehicle.

(14) Install the engine cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION), push rods, rocker arms, bridges, pivots and engine cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Fill the crankcase with engine oil.

PISTON RINGS

STANDARD PROCEDURE - PISTON RING FITTING

(1) Carefully clean the carbon from all ring grooves. Oil drain openings in the oil ring groove and pin boss must be clear. **DO NOT** remove metal from the grooves or lands. This will change ring-to-groove clearances and will damage the ring-to-land seating.

(2) Be sure the piston ring grooves are free of nicks and burrs.

(3) Measure the ring side clearance with a feeler gauge fitted snugly between the ring land and ring (Fig. 62) (Fig. 63). Rotate the ring in the groove. It must move freely around circumference of the groove.

GROOVE HEIGHT

A 1.530-1.555 mm (0.0602-0.0612 in)
B 4.035-4.060 mm (0.1589-0.1598 in)

805dd885

Fig. 62 Piston Dimensions

805dd887

Fig. 63 Ring Side Clearance Measurement

1 - FEELER GAUGE

PISTON RINGS (Continued)

RING SIDE CLEARANCE CHART

ITEM	SPECIFICATION
Top Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Second Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Oil Control Ring	0.06 - 0.21 mm (0.0024 - 0.0083 in.)

(4) Place ring in the cylinder bore and push down with inverted piston to position near lower end of the ring travel. Measure ring gap with a feeler gauge fitting snugly between ring ends (Fig. 64).

Fig. 64 Gap Measurement

1 - FEELER GAUGE

RING GAP MEASUREMENT CHART

ITEM	SPECIFICATION
Top Compression Ring	0.229 - 0.610 mm (0.0090 - 0.0240 in.)
Second Compression Ring	0.483 - 0.965 mm (0.0190 - 0.080 in.)
Oil Control Ring	0.254 - 1.500 mm (0.010 - 0.060 in.)

(5) The oil control rings are symmetrical, and can be installed with either side up. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(6) The two compression rings are different and cannot be interchanged. The top compression ring can be identified by the shiny coating on the outer sealing surface and can be installed with either side up. (Fig. 65).

(7) The second compression ring has a slight chamfer on the bottom of the inside edge and a dot on the top for correct installation (Fig. 66) and (Fig. 67).

(8) Using a ring installer, install the second compression ring with the dot facing up (Fig. 66) (Fig. 68).

(9) Using a ring installer, install the top compression ring (either side up).

J9009-20

Fig. 70 Vibration Damper Removal Tool 7697

- 1 - VIBRATION DAMPER REMOVAL TOOL
- 2 - WRENCH

VIBRATION DAMPER (Continued)

INSTALLATION

(1) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in position, align the keyway on the vibration damper hub with the crankshaft key and tap the damper onto the crankshaft.

(2) Install the vibration damper retaining bolt and washer.

(3) Tighten the damper retaining bolt to 108 N·m (80 ft. lbs.) torque.

(4) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) and fan shroud.

(5) Connect negative cable to battery.

STRUCTURAL SUPPORT

REMOVAL

The engine bending braces are used to add strength to the powertrain and to address some minor NVH concerns.

NOTE: Before the engine or the transmission can be removed the engine bending braces must be removed.

(1) Raise and support vehicle.

NOTE: Both left and right side bending braces are removed the sameway. Only the right side is shown.

NOTE: The exhaust does not require removal to preform this procedure.

(2) Remove the exhaust hanger bracket retaining bolt.

(3) Remove locknut and transmission bending brace bar.

(4) Remove engine-to-bending brace retaining bolt, bending brace bar and cross bar.

INSTALLATION

NOTE: DO NOT tighten the retaining hardware until all bending braces are in place.

(1) Position the cross brace into the engine-to-transmission brace, then position the engine-to-transmission brace and install retaining bolt.

(2) Position the transmission bending brace onto through brace and install new locknut.

(3) Position exhaust hanger and transmission brace, install retaining bolt (Fig. 72).

(4) Tighten engine-to-transmission brace retaining bolt (Fig. 71) to 40 N·m (30 ft. lbs.).

(5) Tighten transmission brace retaining bolts (Fig. 72) to 40 N·m (30 ft. lbs.), then tighten transmission brace retaining lock nuts (Fig. 72) to 108 N·m (80 ft. lbs.).

Fig. 71 Engine-to-Transmission Bending Braces

1 - ENGINE-TO-TRANSMISSION BENDING BRACE

2 - CROSS BRACE

3 - ENGINE-TO-TRANSMISSION BENDING BRACE RETAINING BOLT

LUBRICATION

DESCRIPTION

A gear-type positive displacement pump is mounted at the underside of the block opposite the No. 4 main bearing.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery which extends the entire length of the block.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals (except number 4 main bearing journal) to the connecting rod journals. Each connecting rod bearing cap has a small squirt hole, oil

LUBRICATION (Continued)

Fig. 72 Transmission Bending Braces and Exhaust Hanger

- 1 - TRANSMISSION BENDING BRACE RETAINING BOLT
- 2 - ENGINE-TO-TRANSMISSION BENDING BRACE
- 3 - LOCKNUT
- 4 - TRANSMISSION BRACE
- 5 - EXHAUST HANGER

passes through the squirt hole and is thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. Oil is provided to the camshaft bearing through galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the number one main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components, then passes down through the push rod guide holes in the cylinder head past the valve tappet area, and returns to the oil pan (Fig. 73).

DIAGNOSIS AND TESTING - ENGINE OIL PRESSURE

(1) Disconnect connector and remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292 or equivalent. Start engine and record pressure. (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct pressures.

DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat inspection.

(4) If the oil leak source is not positively identified at this time, proceed with the air leak detection test method.

Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the CCV valve from the cylinder head cover. Cap or plug the CCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.

(5) If the leakage occurs at the rear oil seal area, **INSPECTION FOR REAR SEAL AREA LEAKS .**

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the CCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the

LUBRICATION (Continued)

80be47c9

Fig. 73 Oil Lubrication System—4.0L Engine

- 1 - CAM/CRANK MAIN GALLERY (7)
- 2 - TAPPET GALLERY

- 5 - NUMBER 1 CAMSHFT BEARING JOURNAL
- 6 - CAMSHAFT SPROCKET
- 7 - TAPPET GALLERY

LUBRICATION (Continued)

engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
- (4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

OIL

STANDARD PROCEDURE - ENGINE OIL SERVICE

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Hoist and support vehicle on safety stands.
- (3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.

(6) Install drain plug in crankcase.

(7) Replace engine oil filter. (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type of engine oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) and amount of engine oil (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).

(9) Install oil fill cap.

(10) Start engine and inspect for leaks.

(11) Stop engine and inspect oil level. Refer to CRANKCASE OIL LEVEL INSPECTION .

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

The engine oil level indicator (Dipstick) is located at the right rear of the 4.0L engine. Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick (Fig. 74).

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading (Fig. 74).

OIL (Continued)

(6) Add oil only if level is below the ADD mark on dipstick.

Fig. 74 Engine Oil Dipstick—4.0L Engine

- 1 - DIPSTICK
- 2 - ADD
- 3 - SAFE

OIL FILTER

REMOVAL

CAUTION: Do not use oil filter with metric threads. The proper oil filter has SAE type 3/4 X 16 threads. An oil filter with metric threads can result in oil leaks and engine failure.

All Jeep engines are equipped with a high quality full-flow, throw-away type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

(1) Position a drain pan under the oil filter.
 (2) Using a suitable oil filter wrench loosen filter.
 (3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss or filter adapter housing (Fig. 75).

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) Make sure old gasket comes off with oil filter. With a wiping cloth, clean the gasket sealing surface (Fig. 76) of oil and grime.

INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 76) hand tighten filter one full turn, do not over tighten.

Fig. 75 Oil Filter—4.0L Engine

- 1 - CYLINDER BLOCK
- 2 - ADAPTER
- 3 - OIL FILTER

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

Fig. 76 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

OIL PAN

DESCRIPTION

The oil pan is made of stamped steel. The oil pan gasket is a one piece steel backbone silicone coated gasket (Fig. 77).

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise the vehicle.
- (3) Remove the oil pan drain plug and drain the engine oil.
- (4) Disconnect the exhaust pipe at the exhaust manifold.

OIL PAN (Continued)

**Fig. 77 Oil Pan**

- 1 - OIL PAN
2 - OIL PAN DRAIN PLUG

(5) Disconnect the exhaust hanger at the catalytic converter and lower the pipe.

(6) Remove the starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

(7) Remove the engine flywheel and transmission torque converter housing access cover.

(8) If equipped with an oil level sensor, disconnect the sensor.

(9) Position a jack stand directly under the engine vibration damper.

(10) Place a piece of wood (2 x 2) between the jack stand and the engine vibration damper.

(11) Remove the engine mount through bolts.

(12) Using the jack stand, raise the engine until adequate clearance is obtained to remove the oil pan.

(13) Remove transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that are attached to the oil pan studs.

(14) Remove the oil pan bolts and studs. Carefully slide the oil pan and gasket to the rear. If equipped with an oil level sensor, take care not to damage the sensor.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Fabricate 4 alignment dowels from 1 1/2 x 1/4 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 78).

(3) Install two dowels in the timing case cover. Install the other two dowels in the cylinder block (Fig. 79).

(4) Apply Mopar® Silicone Rubber Adhesive Sealant on cylinder block to rear main bearing cap cor-

**Fig. 78 Fabrication of Alignment Dowels**

- 1 - 1/4" x 1 1/2" BOLT
2 - DOWEL
3 - SLOT

3 - 5/16" HOLES
4 - 5/16" HOLES

ners and cylinder block to front cover joints (four places) (Fig. 80).

(5) Slide the one-piece gasket over the dowels and onto the block and timing case cover.

(6) Position the oil pan over the dowels and onto the gasket. If equipped with an oil level sensor, take care not to damage the sensor.

(7) Install the 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque. Install the 5/16 inch oil pan bolts (Fig. 81). Tighten these bolts to 15 N·m (132 in. lbs.) torque.

(8) Remove the dowels. Install the remaining 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque.

(9) Lower the engine until it is properly located on the engine mounts.

OIL PAN (Continued)

**Fig. 80 Oil Pan Sealer Location**

1 - SEALER LOCATIONS

**Fig. 81 Position of 5/16 inch Oil Pan Bolts**

1 - OIL PAN

2 - OIL PAN DRAIN PLUG

(10) Install the through bolts and tighten the nuts.
 (11) Lower the jack stand and remove the piece of wood.

(12) Install the engine flywheel and transmission torque converter housing access cover.

(13) Install the engine starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

(14) Connect the exhaust pipe to the hanger and to the engine exhaust manifold.

(15) Install transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that attach to the oil pan studs.

(16) Install the oil pan drain plug (Fig. 81). Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(17) Lower the vehicle.

(18) Connect negative cable to battery.

(19) Fill the oil pan with engine oil to the specified level.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR

HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(20) Start the engine and inspect for leaks.

ENGINE OIL PRESSURE SENSOR

DESCRIPTION

The 3-wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

OIL PUMP

REMOVAL

A gear-type oil pump is mounted at the underside of the cylinder block opposite the No.4 main bearing.

(1) Drain the engine oil.

(2) Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(3) Remove the pump-to-cylinder block attaching bolts. Remove the pump assembly with gasket (Fig. 82).

CAUTION: If the oil pump is not to be serviced, DO NOT disturb position of oil inlet tube and strainer assembly in pump body. If the tube is moved within the pump body, a replacement tube and strainer assembly must be installed to assure an airtight seal.

OIL PUMP (Continued)

J9509-85

Fig. 82 Oil Pump Assembly

- 1 - OIL FILTER ADAPTOR
- 2 - BLOCK
- 3 - GASKET
- 4 - OIL INLET TUBE
- 5 - OIL PUMP
- 6 - STRAINER ASSEMBLY
- 7 - ATTACHING BOLTS

INSTALLATION

A gear-type oil pump is mounted at the underside of the cylinder block opposite the No.4 main bearing.

(1) Install the oil pump on the cylinder block using a replacement gasket. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(2) Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(3) Fill the oil pan with oil to the specified level.

INTAKE MANIFOLD**DESCRIPTION**

The intake manifold (Fig. 83) is made of cast aluminum and uses eleven bolts to mount to the cylinder head. This mounting style improves sealing and reduces the chance of leaks.

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE DIAGNOSIS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

80bc4bb8

Fig. 83 Intake Manifold 4.0L Engine

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPM is observed the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

NOTE: THE ENGINE INTAKE AND EXHAUST MANIFOLD MUST BE REMOVED AND INSTALLED TOGETHER. THE MANIFOLDS USE A COMMON GASKET AT THE CYLINDER HEAD.

- (1) Disconnect the battery negative cable.
- (2) Remove air cleaner inlet hose from the resonator assembly.
- (3) Remove the air cleaner assembly.
- (4) Remove the throttle cable, vehicle speed control cable (if equipped) and the transmission line pressure cable (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - REMOVAL).
- (5) Disconnect the following electrical connections and secure their harness out of the way:
 - Throttle Position Sensor
 - Idle Air Control Motor
 - Coolant Temperature Sensor (at thermostat housing)
 - Intake Air Temperature Sensor
 - Oxygen Sensor
 - Crank Position Sensor
 - Six (6) Fuel Injector Connectors
 - Manifold Absolute Pressure (MAP) Sensor.

INTAKE MANIFOLD (Continued)

(6) Disconnect HVAC, and Brake Booster vacuum supply hoses at the intake manifold.

(7) Perform the fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(8) Disconnect and remove the fuel system supply line from the fuel rail assembly.

(9) Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Remove the power steering pump from the intake manifold and set aside.

(11) Raise the vehicle.

(12) Disconnect the exhaust pipes from the engine exhaust manifolds.

(13) Lower the vehicle.

(14) Remove the intake manifold and exhaust manifold bolts and manifolds (Fig. 84).

INSTALLATION

If the manifold is being replaced, ensure all the fitting, etc. are transferred to the replacement manifold.

(1) Install a new engine exhaust/intake manifold gasket over the alignment dowels on the cylinder head.

(2) Position the engine exhaust manifolds to the cylinder head. Install fastener Number 3 and finger tighten at this time (Fig. 84).

(3) Install intake manifold on the cylinder head dowels.

(4) Install washer and fastener Numbers 1, 2, 4, 5, 8, 9, 10 and 11 (Fig. 84).

(5) Install washer and fastener Numbers 6 and 7 (Fig. 84).

(6) Tighten the fasteners in sequence and to the specified torque (Fig. 84).

- Fastener Numbers 1 through 5—Tighten to 33 N·m (24 ft. lbs.) torque.

- Fastener Numbers 6 and 7—Tighten to 31 N·m (23 ft. lbs.) torque.

- Fastener Numbers 8 through 11—Tighten to 33 N·m (24 ft. lbs.) torque.

(7) Install the power steering pump to the intake manifold.

Fig. 84 Intake and Exhaust Manifolds Installation

(8) Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install the fuel system supply line to the fuel rail assembly.

(10) Connect all electrical connections on the intake manifold.

(11) Connect the vacuum hoses previously removed.

(12) Install throttle cable, vehicle speed control cable (if equipped).

(13) Install the transmission line pressure cable (if equipped) (Refer to 21 - TRANSMISSION/TRANS-AXLE/AUTOMATIC - AW4/THROTTLE VALVE CABLE - INSTALLATION).

(14) Install air cleaner assembly.

(15) Connect air inlet hose to the resonator assembly.

(16) Raise the vehicle.

(17) Connect the exhaust pipes to the engine exhaust manifolds. Tighten the bolts to 31 N·m (23 ft. lbs.)

(18) Lower the vehicle.

(19) Connect the battery negative cable.

(20) Start the engine and check for leaks.

EXHAUST MANIFOLD

DESCRIPTION

The two exhaust manifolds (Fig. 85) are log style and are made of high silicon molybdenum cast iron. The exhaust manifolds share a common gasket with the intake manifold. The exhaust manifolds also incorporate ball flange outlets for improved sealing and strain free connections.

REMOVAL

The intake and engine exhaust manifolds on the 4.0L engine must be removed together. The manifolds use a common gasket at the cylinder head.

(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

INSTALLATION

(1) The exhaust manifold and the intake manifold must be installed together using a common gasket.

(2) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

TIMING BELT / CHAIN COVER(S)

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(3) Remove the fan, hub assembly and fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(4) Remove the accessory drive brackets that are attached to the timing case cover.

(5) Remove the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL) (if equipped) and generator bracket assembly from the engine cylinder head and move to one side.

(6) Remove the oil pan-to-timing case cover bolts and timing case cover-to-cylinder block bolts.

(7) Remove the timing case cover and gasket from the engine.

(8) Pry the crankshaft oil seal from the front of the timing case cover (Fig. 86).

80abd2b1

Fig. 86 Timing Case Cover Components

- 4 - VIBRATION DAMPER PULLEY

80bbccb8

Fig. 85 EXHAUST MANIFOLDS 4.0L ENGINE

TIMING BELT / CHAIN COVER(S) (Continued)

INSTALLATION

Clean the timing case cover, oil pan and cylinder block gasket surfaces.

(1) Install a new crankshaft oil seal in the timing case cover. The open end of the seal should be toward the inside of the cover. Support the cover at the seal area while installing the seal. Force it into position with Seal Installation Tool 6139.

(2) Position the gasket on the cylinder block.

(3) Position the timing case cover on the oil pan gasket and the cylinder block.

(4) Insert Timing Case Cover Alignment and Seal Installation Tool 6139 in the crankshaft opening in the cover (Fig. 87).

J9009-23

Fig. 87 Timing Case Cover Alignment

1 - TIMING CASE COVER ALIGNMENT AND SEAL INSTALLATION TOOL

(5) Install the timing case cover-to-cylinder block and the oil pan-to-timing case cover bolts.

(6) Tighten the 1/4 inch cover-to-block bolts to 7 N·m (60 in. lbs.) torque. Tighten the 5/16 inch front cover-to-block bolts to 22 N·m (192 in. lbs.) torque. Tighten the oil pan-to-cover 1/4 inch bolts to 9.5 N·m (84 in. lbs.) torque.

(7) Remove the cover alignment tool.

(8) Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(9) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(10) Install the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION) (if equipped) and generator bracket assembly.

(11) Install the engine fan, hub assembly and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(12) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(13) Connect negative cable to battery.

TIMING BELT/CHAIN AND SPROCKETS**REMOVAL**

(1) Disconnect negative cable from battery.

(2) Remove the fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(3) Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(4) Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(5) Remove the timing case cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(6) Rotate crankshaft until the "0" timing mark is closest to and on the center line with camshaft sprocket timing mark (Fig. 88).

80bfe0fa

Fig. 88 Crankshaft—Camshaft Alignment

1 - CAMSHAFT SPROCKET

2 - TIMING MARKS

3 - CRANKSHAFT SPROCKET

TIMING BELT/CHAIN AND SPROCKETS (Continued)

- (7) Remove the oil slinger from the crankshaft.
- (8) Remove the camshaft sprocket bolt and washer (Fig. 89).

80ble167

Fig. 89 Camshaft Sprocket and Thrust Plate

- 1 - CAMSHAFT
- 2 - CAMSHAFT SPROCKET W/INTEGRAL KEY
- 3 - BOLT AND WASHER
- 4 - THRUST PLATE

- (9) Remove the crankshaft sprocket, camshaft sprocket and timing chain as an assembly.

(10) Installation of the timing chain with the timing marks on the crankshaft and camshaft sprockets properly aligned ensures correct valve timing. A worn or stretched timing chain will adversely affect valve timing. If the timing chain deflects more than 12.7 mm (1/2 inch) replace it.

INSTALLATION

Assemble the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned (Fig. 88).

(1) Apply Mopar® Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in the keyway on the crankshaft, install the assembly on the crankshaft and camshaft.

(2) Install the camshaft sprocket bolt and washer (Fig. 89). Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(3) To verify correct installation of the timing chain, rotate the crankshaft 2 revolutions. The camshaft and crankshaft sprocket timing mark should align (Fig. 88).

(4) Install the crankshaft oil slinger.

(5) Replace the oil seal in the timing case cover (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - REMOVAL).

(6) Install the timing case cover and gasket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(7) With the key installed in the crankshaft keyway, install the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(8) Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(9) Install the fan, hub assembly and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(10) Connect negative cable to battery.

ENGINE 4.7L

DESCRIPTION—4.7L ENGINE

80b3b148

The 4.7 liter (287 CID) eight-cylinder engine is an 90° single overhead camshaft engine. The cast iron cylinder block is made up of two different components; the first component is the cylinder bore and upper block, the second component is the bedplate that comprises the lower portion of the cylinder block and houses the lower half of the crankshaft main bearings. The cylinders are numbered from front to rear with the left bank being numbered 1,3,5 and 7, and the right bank being numbered 2,4,6 and 8. The firing order is 1-8-4-3-6-5-7-2. The engine serial number is located at the right front side of the engine block (Fig. 1)

DIAGNOSIS AND TESTING—ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

ENGINE 4.7L (Continued)

**Fig. 1 Engine Identification Location**

- 1 - VEHICLE VIN NUMBER LOCATION
 2 - CYLINDER BLOCK RIGHT HAND SIDE
 3 - CYLINDER BORE #2

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—PERFORMANCE and (Refer to 9 - ENGINE -

DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

DIAGNOSIS AND TESTING—SERVICE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery 2. Corroded or loose battery connections. 3. Faulty starter. 4. Faulty coil or control unit. 5. Incorrect spark plug gap. 6. Dirt or water in fuel system. 7. Faulty fuel pump, relay or wiring.	1. Charge or replace as necessary. 2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals. 3. (Refer to 8 - ELECTRICAL/ STARTING - DIAGNOSIS AND TESTING). 4. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/IGNITION COIL - REMOVAL). 5. (Refer to 8 - ELECTRICAL/ IGNITION CONTROL/SPARK PLUG - CLEANING). 6. Clean system and replace fuel filter. 7. Repair or replace as necessary.

ENGINE 4.7L (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE STALLS OR ROUGH IDLE	<ol style="list-style-type: none"> 1. Idle speed set to low. 2. Idle mixture too lean or too rich. 3. Vacuum leak. 4. Faulty coil. 5. OIL PUMPING AT RINGS; SPARK PLUGS FOULING	<ol style="list-style-type: none"> 1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking valve guide seals. 	<ol style="list-style-type: none"> 1. Hone cylinder bores and replace rings. 2. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE). 3. Replace rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE). 4. Ream guides and replace valves (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - STANDARD PROCEDURE). 5. Replace valve guide seals.

DIAGNOSIS AND TESTING—CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

(1) Clean the spark plug recesses with compressed air.

(2) Remove the spark plugs.

(3) Secure the throttle in the wide-open position.

(4) Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).

(5) Disconnect the ignition coil.

(6) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.

(7) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

ENGINE 4.7L (Continued)

(Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

DIAGNOSIS AND TESTING—CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART .

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

STANDARD PROCEDURE—REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.

- Installing an insert into the tapped hole to bring the hole back to its original thread size.

STANDARD PROCEDURE—FORM-IN-PLACE GASKETS & SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too

ENGINE 4.7L (Continued)

thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II

Mopar® Engine RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV

Mopar® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER

Mopar® Gasket Maker is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT

Mopar® Gasket Sealant is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

FORM-IN-PLACE GASKET AND SEALER APPLICATION

Assembling parts using a form-in-place gasket requires care but it's easier then using precut gaskets.

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can eas-

ily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

STANDARD PROCEDURES - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush (Fig. 2)

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (Fig. 2)
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (Fig. 2)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

ENGINE 4.7L (Continued)

Fig. 2 PROPER TOOL USAGE FOR SURFACE PREPARATION

- 1 - ABRASIVE PAD
- 2 - 3M ROLOC™ BRISTLE DISC
- 3 - PLASTIC/WOOD SCRAPER

STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 3).

Fig. 3 CORE HOLE PLUG REMOVAL

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Remove the front fascia.
- (3) Raise vehicle on hoist.
- (4) Remove exhaust crossover pipe from exhaust manifolds.
- (5) Disconnect two ground straps from the lower left hand side and one ground strap from the lower right hand side of the engine.
- (6) Disconnect crankshaft position sensor. (Fig. 4)
- (7) Remove structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
- (8) Remove starter. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (9) Remove rubber splash shield.
- (10) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (11) Remove torque converter bolts.
- (12) Remove transmission to engine mounting bolts.
- (13) Disconnect the engine block heater power cable from the block heater.
- (14) Lower vehicle.
- (15) Remove throttle body resonator assembly and inlet hose.
- (16) Disconnect throttle and speed control cables.
- (17) Disconnect tube from both the left and right side crankcase breathers, then remove the breathers (Fig. 5).
- (18) Discharge A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
- (19) Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL) and accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (20) Remove A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

Fig. 5 Crankcase Breather Connection Points

- 1 - CRANKCASE BREATHERS

(21) Disconnect transmission oil cooler lines at the radiator.

(22) Disconnect radiator lower hose at the thermostat housing.

(23) Remove A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL).

(24) Remove radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).

(25) Remove generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

(26) Disconnect the two heater hoses from the timing chain cover.

(27) Disconnect engine harness at the following points :

- Intake air temperature (IAT) sensor (Fig. 6)
- Fuel Injectors
- Throttle Position (TPS) Switch
- Idle Air Control (IAC) Motor
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold absolute pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

Fig. 6 Throttle Body Connection Points

- 1 - THROTTLE BODY
- 2 - TPS
- 3 - IAC MOTOR
- 4 - IAT SENSOR
- 5 - MOUNTING SCREWS

(28) Release fuel rail pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE) then disconnect the fuel supply quick connect fitting at the fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(29) Remove power steering pump and position out of the way.

ENGINE 4.7L (Continued)

(30) Disconnect ground straps from the left side of the engine.

(31) Install Engine Lifting Fixture Special Tool 8347 (Fig. 7) following these steps.

- Holding the lifting fixture at a slight angle, slide the large bore in the front plate over the hex portion of the lifting stud.
- Position the two remaining fixture arms onto the two lifting studs in the cylinder heads.
- Pull forward and upward on the lifting fixture so that the lifting stud rest in the slotted area below the large bore.
- Secure the lifting fixture to the three studs using three 7/16 - 14 N/C locknuts.
- Make sure the lifting loop in the lifting fixture is in the last hole (closest to the throttle body) to minimize the angle of engine during removal.

Fig. 7 Engine Lifting Fixture Attachment Locations

- 1 - ATTACHING LOCATION
 2 - ADJUSTABLE HOOK
 3 - SPECIAL TOOL 8347 ENGINE LIFT FIXTURE
 4 - ATTACHING LOCATIONS

(32) Disconnect body ground strap at the right side cowl.

NOTE: It will be necessary to support the transmission in order to remove the engine.

(33) Position a suitable jack under the transmission.

(34) Remove the engine mount through bolts.

(35) Raise engine slightly, then remove both left and right side engine mounts from engine. (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - REMOVAL).

(36) Remove engine from the vehicle.

INSTALLATION

(1) Position engine in the vehicle.

(2) Install both left and right side engine mounts onto engine (Refer to 9 - ENGINE/ENGINE MOUNTING/FRONT MOUNT - INSTALLATION).

(3) Install transmission to engine mounting bolts. Tighten the bolts to 41 N·m (30 ft. lbs.).

(4) Remove jack from under the transmission.

(5) Remove engine lifting fixture special tool 8347 (Fig. 7).

(6) Connect ground straps on the left side of the engine.

(7) Install power steering pump (Refer to 19 - STEERING/PUMP - INSTALLATION).

(8) Connect fuel supply line quick connect fitting (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

(9) Connect engine harness at the following points (Fig. 6):

- Intake Air Temperature (IAT) Sensor
- Idle Air Control (IAC) Motor
- Fuel Injectors
- Throttle Position (TPS) Switch
- Engine Oil Pressure Switch
- Engine Coolant Temperature (ECT) Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Camshaft Position (CMP) Sensor
- Coil Over Plugs

(10) Install generator (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

(11) Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).

(12) Install A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

(13) Connect radiator lower hose at the thermostat housing.

(14) Connect the transmission oil cooler lines to the radiator.

(15) Install A/C compressor. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

ENGINE 4.7L (Continued)

(16) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION) and radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(17) Install breathers, then connect tube to both crankcase breathers (Fig. 5).

(18) Connect throttle and speed control cables.

(19) Install throttle body resonator assembly and inlet hose.

(20) Raise vehicle.

(21) Connect two ground straps on the lower left hand side of the engine and one ground strap on the lower right side.

(22) Install torque converter bolts.

(23) Connect crankshaft position sensor (Fig. 4).

(24) Install starter.

(25) Install rubber splash shield.

CAUTION: The structural cover requires a specific torque sequence. Failure to follow this sequence may cause severe damage to the cover.

(26) Install structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

(27) Install exhaust crossover pipe.

(28) Install engine block heater power cable, If equipped.

(29) Lower vehicle.

(30) Check and fill engine oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

(31) Recharge the A/C system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).

(32) Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(33) Connect the battery negative cable.

(34) Start engine and check for leaks.

AIR CLEANER ELEMENT

REMOVAL - 4.7L

(1) Unlatch four clips retaining air cleaner cover to air cleaner housing (Fig. 8).

80b89902

Fig. 8 Air Cleaner Assembly - 4.7L

- 1 - AIR DUCT
- 2 - CLAMPS
- 3 - AIR CLEANER COVER
- 4 - CLIPS
- 5 - HOUSING
- 6 - HOUSING BOLTS (3)
- 7 - LOWER HOUSING NUTS (3)
- 8 - RESONATOR BOLTS
- 9 - RESONATOR

- (2) Lift cover up and position to the side.
- (3) Remove air cleaner element.

INSTALLATION - 4.7L

- (1) Clean inside of air cleaner housing before installing new element.
- (2) Install air cleaner element into housing.
- (3) Latch clips and clamp cover down to secure. Be sure air cleaner cover is properly seated to air cleaner housing.

AIR CLEANER HOUSING

REMOVAL - 4.7L

- (1) Disconnect air cleaner cover-to-air duct clamp (Fig. 8).
- (2) Disconnect air duct at housing.
- (3) **Each of the 3 air cleaner housing mounting bolts is attached with 2 nuts (an upper nut and lower nut). DO NOT REMOVE BOLTS. To prevent stripping bolts, only remove lower nuts. The lower housing nuts are located under left front inner fender (Fig. 8).**
 - (a) To gain access to lower nuts, raise vehicle.
 - (b) Remove clips retaining rubber inner fender shield.
 - (c) Pry back shield enough to gain access to lower nuts.
 - (d) Remove 3 nuts.
 - (e) Remove air cleaner assembly from vehicle.
- (4) If resonator is to be removed, disconnect breather tube at resonator, disconnect air duct clamp at resonator (Fig. 8) and remove 2 resonator mounting bolts (at sides of resonator). Remove resonator from throttle body by loosening clamp at throttle body.

INSTALLATION - 4.7L

- (1) Position air cleaner assembly to body and install 3 nuts. Tighten nuts to 10 N·m (93 in. lbs.) torque. **To prevent excessive vibration transmitted through housing, the nuts must be properly torqued. Do not overtighten nuts.**
- (2) If resonator was removed: Install resonator and bolts. Tighten bolts to 4 N·m (35 in. lbs.) torque. Tighten clamp at throttle body to 4 N·m (35 in. lbs.) torque.
- (3) Position fender liner and install clips.
- (4) Connect air duct at housing (Fig. 8).
- (5) Tighten air duct clamp.

CYLINDER HEAD - LEFT

DESCRIPTION—CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

DESCRIPTION—VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide ream-

CYLINDER HEAD - LEFT (Continued)

ing is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

DIAGNOSIS AND TESTING—HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

- Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

- Remove suspected lash adjusters, and replace.

- Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise the vehicle on a hoist.
- (3) Disconnect the exhaust pipe at the left side exhaust manifold.

- (4) Drain the engine coolant. (Refer to 7 - COOLING - STANDARD PROCEDURE).

- (5) Lower the vehicle.

- (6) Remove the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

CYLINDER HEAD - LEFT (Continued)

(7) Remove the cylinder head cover. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(8) Remove accessory drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(9) Remove the power steering pump and set aside.

(10) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 9).

Fig. 9 Engine Top Dead Center

- 1 - TIMING CHAIN COVER
- 2 - CRANKSHAFT TIMING MARKS

(11) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 11). Rotate the crankshaft one turn if necessary.

(12) Remove the crankshaft damper. (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(14) Lock the secondary timing chains to the idler sprocket using Special Tool 8515 (Fig. 10).

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(15) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 11).

Fig. 10 Using Special Tool 8515 to Hold Chains to Idler Sprocket.

- 1 - LOCK ARM
- 2 - RIGHT CAMSHAFT CHAIN
- 3 - SECONDARY CHAINS RETAINING PINS (4)
- 4 - IDLER SPROCKET
- 5 - LEFT CAMSHAFT CHAIN
- 6 - SPECIAL TOOL 8515

(16) Remove the left side secondary chain tensioner. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove the cylinder head access plug (Fig. 12).

(18) Remove the left side secondary chain guide. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(19) Remove the retaining bolt and the camshaft drive gear.

CAUTION: Do not allow the engine to rotate. Severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

NOTE: The cylinder head is attached to the cylinder block with fourteen bolts.

(20) Remove the cylinder head retaining bolts.

(21) Remove the cylinder head and gasket. Discard the gasket.

CYLINDER HEAD - LEFT (Continued)

**Fig. 11 Camshaft Sprocket V8 Marks**

- 1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

**Fig. 12 Cylinder Head Access Plugs**

- 1 - RIGHT CYLINDER HEAD ACCESS PLUG
2 - LEFT CYLINDER HEAD ACCESS PLUG

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

INSPECTION

- (1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
- (2) Inspect the valve seats for damage. Service the valve seats as necessary.
- (3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

INSTALLATION

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 13).

CYLINDER HEAD - LEFT (Continued)

Fig. 13 Checking Cylinder Head Bolts for Stretching (Necking)

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Refer to 9 - ENGINE - STANDARD PROCEDURE).

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M11 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar® Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence (Fig. 14) using the following steps and torque values:

- Step 1: Tighten bolts 1-10, 20 N·m (15 ft. lbs.).
- Step 2: Tighten bolts 1-10, 47 N·m (35 ft. lbs.). Tighten bolts 11-14, 25 N·m (18 ft. lbs.).
- Step 3: Tighten bolts 1-10, 90 degrees. Tighten bolts 11-14, 26 N·m (19 ft. lbs.).

◆ INDICATES SEALER APPLIED TO THREADS

80b76fa7

Fig. 14 Cylinder Head Tightening Sequence

(7) Install the secondary chain and secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(8) Install the cylinder head access plug.

(9) Re-set and Install the left side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

(10) Remove Special Tool 8515.

(11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

(12) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(13) Install the power steering pump.

(14) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

(15) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

(16) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(17) Raise the vehicle.

(18) Install the exhaust pipe onto the left exhaust manifold.

(19) Lower the vehicle.

(20) Connect the negative cable to the battery.

(21) Start the engine and check for leaks.

CAMSHAFT(S) - LEFT

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, **DO NOT** forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use Special Tool 8350 will result in hydraulic tensioner ratchet over extension, requiring timing chain cover removal to reset the tensioner ratchet.

(1) Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) .

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel (Located on the right side camshaft sprocket) for any reason, Severe damage will occur to the target wheel resulting in a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave the bolt snug against the sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands, tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 15).

CAMSHAFT(S) - LEFT (Continued)

(6) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 16).

Fig. 16 Camshaft Sprocket and Chain

- 1 - CAMSHAFT SPROCKET AND CHAIN
2 - ADJUSTABLE PLIERS
3 - CAMSHAFT

CAMSHAFT(S) - LEFT (Continued)

(7) Using the pliers, gently allow the camshaft to rotate 15° clockwise until the camshaft is in the neutral position (no valve load).

(8) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

(9) Remove the camshaft bearing caps and the camshaft.

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the left side camshaft so that the camshaft sprocket dowel is near the 1 o'clock position, This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 17).

80b6b398

Fig. 17 Camshaft Bearing Caps Tightening Sequence

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

CAMSHAFT(S) - LEFT (Continued)

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 18).

Fig. 18 Timing Chain to Sprocket Alignment

- 1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

CAMSHAFT(S) - LEFT (Continued)

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 19).

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

(8) Remove excess oil from bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove Special Tool 8350 timing chain wedge (Fig. 20).

CYLINDER HEAD COVER(S) - LEFT

DESCRIPTION

The cylinder head covers are made of die cast magnesium, and are not interchangeable from side-to-side. It is imperative that nothing rest on the cylinder head covers. Prolonged contact with other items may wear a hole in the cylinder head cover.

REMOVAL—LEFT SIDE

- (1) Disconnect negative cable from battery.
- (2) Remove the resonator assemble and air inlet hose.

(3) Disconnect injector connectors and un-clip the injector harness.

(4) Route injector harness in front of cylinder head cover.

(5) Disconnect the left side breather tube and remove the breather tube.

(6) Remove the cylinder head cover mounting bolts.

(7) Remove cylinder head cover and gasket.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

CLEANING

Clean cylinder head cover gasket surface.

Clean head rail, if necessary.

INSTALLATION—LEFT SIDE

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: DO NOT allow other components including the wire harness to rest on or against the cylinder head cover. Prolonged contact with other objects may wear a hole in the engine cylinder head cover.

(1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.

(2) Install cylinder head cover and hand start all fasteners. Verify that all studs are in the correct location shown in (Fig. 22).

Fig. 22 Cylinder Head Cover—Left

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

(3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs.).

CYLINDER HEAD COVER(S) - LEFT (Continued)

- (4) Install left side breather and connect breather tube.
- (5) Connect injector electrical connectors and injector harness retaining clips.
- (6) Install the resonator and air inlet hose.
- (7) Connect negative cable to battery.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

STANDARD PROCEDURE—REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in.).

(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

(3) When the seat is properly positioned the width of the intake seat must be 1.75 – 2.36 mm (0.0689 – 0.0928 in.) and the exhaust seat must be 1.71 – 2.32 mm (0.0673 – 0.0911 in.).

(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 41.44 mm (1.6315 in.).

(5) The valve seat and valve face must maintain a face angle of 44.5 – 45 degrees angle (Fig. 23).

80b8983f

Fig. 23 Valve Assembly Configuration

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

REMOVAL

NOTE: The cylinder heads must be removed in order to preform this procedure.

(1) Using Special Tool 8516 Valve Spring Compressor, remove the rocker arms and the hydraulic lash adjusters (Fig. 24).

(2) Remove the camshaft bearing caps and the camshaft.

NOTE: All eight valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422-B or C-3422-C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

(4) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

INTAKE/EXHAUST VALVES & SEATS (Continued)

**Fig. 24 Rocker Arm Removal**

- 1 - CAMSHAFT
2 - SPECIAL TOOL 8516

- (5) Remove the valve spring compressor.
(6) Remove the spring retainer, and the spring.

NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

- (7) Remove the valve from the cylinder head.

NOTE: The valve stem seals are common between intake and exhaust.

- (8) Remove the valve stem seal. Mark the valve for proper installation.

TESTING VALVE SPRINGS

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.69 mm (1.602 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer

adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications. (Fig. 25)

**Fig. 25 Testing Valve Springs**

- 1 - SPECIAL TOOL C-647

INSTALLATION

- (1) coat the valve stem with clean engine oil and insert it into the cylinder head.

- (2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

- (3) Install the spring and the spring retainer (Fig. 26).

- (4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

- (5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

- (6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

- (7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9-13 N-m (100 in. lbs.) in 1/2 turn increments in the sequence shown (Fig. 27).

- (8) Position the hydraulic lash adjusters and rocker arms (Fig. 24).

ROCKER ARM / ADJUSTER ASSEMBLY**DESCRIPTION**

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

**Fig. 26 Valve Assembly Configuration**

- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

**Fig. 27 Camshaft Bearing Caps Tightening Sequence**

mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover. Refer to Cylinder Head Cover in this section.

(2) For rocker arm removal on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(3) For rocker arm removal on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(4) For rocker arm removal on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(5) For rocker arm removal on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(6) Using special tool 8516 press downward on the valve spring, remove rocker arm (Fig. 28).

**Fig. 28 Rocker Arm—Removal**

- 1 - CAMSHAFT
- 2 - SPECIAL TOOL 8516

INSTALLATION

CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

NOTE: Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(2) For rocker arm installation on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(3) For rocker arm installation on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(4) For rocker arm installation on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 28).

(6) Install the cylinder head cover.

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

VALVE STEM SEALS

DESCRIPTION

The valve stem seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

CYLINDER HEAD - RIGHT

DESCRIPTION—CYLINDER HEAD

The cylinder heads are made of an aluminum alloy. The cylinder head features two valves per cylinder with pressed in powdered metal valve guides. The cylinder heads also provide enclosures for the timing chain drain, necessitating unique left and right cylinder heads.

DESCRIPTION—VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CYLINDER HEAD - RIGHT (Continued)

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

DIAGNOSIS AND TESTING—HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

A tappet-like noise may be produced from several items. Check the following items.

(1) Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.

(2) Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.

(3) Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.

(4) Low oil pressure.

(5) The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.

(6) Air ingested into oil due to broken or cracked oil pump pick up.

(7) Worn valve guides.

(8) Rocker arm ears contacting valve spring retainer.

(9) Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.

(10) Faulty lash adjuster.

- Check lash adjusters for sponginess while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Spongy adjusters can be bottomed out easily.

- Remove suspected lash adjusters, and replace.

- Before installation, make sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.

REMOVAL

(1) Disconnect battery negative cable.

(2) Raise the vehicle on a hoist.

(3) Disconnect the exhaust pipe at the right side exhaust manifold.

(4) Drain the engine coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).

(5) Lower the vehicle.

(6) Remove the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

(7) Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(8) Remove oil fill housing from cylinder head.

(9) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(10) Rotate the crankshaft until the damper timing mark is aligned with TDC indicator mark (Fig. 9).

(11) Verify the V8 mark on the camshaft sprocket is at the 12 o'clock position (Fig. 11). Rotate the crankshaft one turn if necessary.

(12) Remove the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

(13) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(14) Lock the secondary timing chains to the idler sprocket using Special Tool 8515 (Fig. 10).

NOTE: Mark the secondary timing chain prior to removal to aid in installation.

(15) Mark the secondary timing chain, one link on each side of the V8 mark on the camshaft drive gear (Fig. 11).

(16) Remove the right side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(17) Remove the cylinder head access plug (Fig. 29).

Fig. 29 Cylinder Head Access Plugs

1 - RIGHT CYLINDER HEAD ACCESS PLUG

2 - LEFT CYLINDER HEAD ACCESS PLUG

(18) Remove the right side secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

(19) Remove the retaining bolt and the camshaft drive gear.

CYLINDER HEAD - RIGHT (Continued)

CAUTION: Do not allow the engine to rotate. severe damage to the valve train can occur.

CAUTION: Do not overlook the four smaller bolts at the front of the cylinder head. Do not attempt to remove the cylinder head without removing these four bolts.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason. A damaged target wheel can result in a vehicle no start condition.

NOTE: The cylinder head is attached to the cylinder block with fourteen bolts.

(20) Remove the cylinder head retaining bolts.

(21) Remove the cylinder head and gasket. Discard the gasket.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, do to the design of the cylinder head gasket any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

INSPECTION

(1) Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.

(2) Inspect the valve seats for damage. Service the valve seats as necessary.

(3) Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.

INSTALLATION

NOTE: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts should be replaced.

Necking can be checked by holding a straight edge against the threads. If all the threads do not contact the scale, the bolt should be replaced (Fig. 13).

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use only a wooden or plastic scraper.

(1) Clean the cylinder head and cylinder block mating surfaces (Refer to 9 - ENGINE - STANDARD PROCEDURE).

(2) Position the new cylinder head gasket on the locating dowels.

CAUTION: When installing cylinder head, use care not damage the tensioner arm or the guide arm.

(3) Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: The four smaller cylinder head mounting bolts require sealant to be added to them before installing. Failure to do so may cause leaks.

(4) Lubricate the cylinder head bolt threads with clean engine oil and install the ten M10 bolts.

(5) Coat the four M8 cylinder head bolts with **Mopar Lock and Seal Adhesive** then install the bolts.

NOTE: The cylinder head bolts are tightened using an angle torque procedure, however, the bolts are not a torque-to-yield design.

(6) Tighten the bolts in sequence (Fig. 30) using the following steps and torque values:

- Step 1: Tighten bolts 1-10, 20 N·m (15 ft. lbs.).
- Step 2: Tighten bolts 1-10, 47 N·m (35 ft. lbs.). Tighten bolts 11-14, 25 N·m (18 ft. lbs.).
- Step 3: Tighten bolts 1-10, 90 degrees. Tighten bolts 11-14, 26 N·m (19 ft. lbs.).

◆ INDICATES SEALER APPLIED TO THREADS

80b76fa7

Fig. 30 Cylinder Head Tightening Sequence

(7) Install the secondary chain and secondary chain guide (Refer to 9 - ENGINE/VALVE TIMING/

CYLINDER HEAD - RIGHT (Continued)

TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

- (8) Install the cylinder head access plug.
- (9) Re-set and install the right side secondary chain tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
- (10) Remove Special Tool 8515.
- (11) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- (12) Install the crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
- (13) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (14) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- (15) Install the intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
- (16) Install oil fill housing onto cylinder head.
- (17) Refill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (18) Raise the vehicle.
- (19) Install the exhaust pipe onto the right exhaust manifold.
- (20) Lower the vehicle.
- (21) Reconnect battery negative cable.
- (22) Start the engine and check for leaks.

CAMSHAFT(S) - RIGHT

DESCRIPTION

The camshafts consist of powdered metal steel lobes which are sinter-bonded to a steel tube. A steel post or nose piece is friction-welded to the steel camshaft tube. Five bearing journals are machined into the camshaft, four on the steel tube and one on the steel nose piece. Camshaft end play is controlled by two thrust walls that border the nose piece journal. Engine oil enters the hollow camshafts at the third journal and lubricates every intake lobe rocker through a drilled passage in the intake lobe.

REMOVAL

CAUTION: When the timing chain is removed and the cylinder heads are still installed, **DO NOT** forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: When removing the cam sprocket, timing chains or camshaft, Failure to use special tool 8350 will result in hydraulic tensioner ratchet over extension, Requiring timing chain cover removal to re-set the tensioner ratchet.

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Set engine to TDC cylinder #1, camshaft sprocket V8 marks at the 12 o'clock position.

(3) Mark one link on the secondary timing chain on both sides of the V8 mark on the camshaft sprocket to aid in installation.

CAUTION: Do not hold or pry on the camshaft target wheel for any reason, Severe damage will occur to the target wheel. A damaged target wheel could cause a vehicle no start condition.

(4) Loosen but **DO NOT** remove the camshaft sprocket retaining bolt. Leave bolt snug against sprocket.

NOTE: The timing chain tensioners must be secured prior to removing the camshaft sprockets. Failure to secure tensioners will allow the tensioners to extend, requiring timing chain cover removal in order to reset tensioners.

CAUTION: Do not force wedge past the narrowest point between the chain strands. Damage to the tensioners may occur.

(5) Position Special Tool 8350 timing chain wedge between the timing chain strands. Tap the tool to securely wedge the timing chain against the tensioner arm and guide (Fig. 31).

(6) Remove the camshaft position sensor (Fig. 32).

(7) Hold the camshaft with adjustable pliers while removing the camshaft sprocket bolt and sprocket (Fig. 33).

(8) Using the pliers, gently allow the camshaft to rotate 45° counter-clockwise until the camshaft is in the neutral position (no valve load).

(9) Starting at the outside working inward, loosen the camshaft bearing cap retaining bolts 1/2 turn at a time. Repeat until all load is off the bearing caps.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing camshaft.

CAMSHAFT(S) - RIGHT (Continued)

Fig. 31 Securing Timing Chain Tensioners Using Timing Chain Wedge

1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

3 - SPECIAL TOOL 8350 WEDGE
4 - SPECIAL TOOL 8350 WEDGE

(10) Remove the camshaft bearing caps and the camshaft.

INSTALLATION

(1) Lubricate camshaft journals with clean engine oil.

NOTE: Position the right side camshaft so that the camshaft sprocket dowel is near the 10 o'clock position. This will place the camshaft at the neutral position easing the installation of the camshaft bearing caps.

(2) Position the camshaft into the cylinder head.

(3) Install the camshaft bearing caps, hand tighten the retaining bolts.

(4) Working in 1/2 turn increments, tighten the bearing cap retaining bolts starting with the middle cap working outward (Fig. 34).

(5) Torque the camshaft bearing cap retaining bolts to 11 N·m (100 in. lbs.).

(6) Position the camshaft drive gear into the timing chain aligning the V8 mark between the two marked chain links (Two links marked during removal) (Fig. 35).

(7) Using the adjustable pliers, rotate the camshaft until the camshaft sprocket dowel is aligned with the slot in the camshaft sprocket. Install the sprocket onto the camshaft (Fig. 36).

CAUTION: Remove excess oil from camshaft sprocket bolt. Failure to do so can cause bolt over-torque resulting in bolt failure.

(8) Remove excess oil from camshaft sprocket bolt, then install the camshaft sprocket retaining bolt and hand tighten.

(9) Remove timing chain wedge special tool 8350 (Fig. 31).

(10) Using Special Tool 6958 spanner wrench with adapter pins 8346 (Fig. 37), torque the camshaft sprocket retaining bolt to 122 N·m (90 ft. lbs.).

(11) Install the camshaft position sensor (Fig. 32).

(12) Install the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

CYLINDER HEAD COVER(S) - RIGHT

DESCRIPTION

The cylinder head covers are made of die cast magnesium, and are not interchangeable from side-to-side. It is imperative that nothing rest on the cylinder head covers. Prolonged contact with other items may wear a hole in the cylinder head cover.

REMOVAL—RIGHT SIDE

- (1) Disconnect battery negative cable.
- (2) Remove air cleaner assembly, resonator assembly and air inlet hose.
- (3) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (4) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (5) Remove air conditioning compressor retaining bolts and move compressor to the left.
- (6) Remove heater hoses.
- (7) Disconnect injector and ignition coil connectors.
- (8) Disconnect and remove positive crankcase ventilation (PCV) hose.
- (9) Remove oil fill tube.
- (10) Un-clip injector and ignition coil harness and move away from cylinder head cover.
- (11) Remove right rear breather tube and filter assembly.
- (12) Remove cylinder head cover retaining bolts.
- (13) Remove cylinder head cover.

NOTE: The gasket may be used again, provided no cuts, tears, or deformation has occurred.

CLEANING

- Clean cylinder head cover gasket surface.
- Clean head rail, if necessary.

INSTALLATION—RIGHT SIDE

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: DO NOT allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

- (1) Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.

- (2) Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location shown in (Fig. 38).

Fig. 38 Cylinder Head Cover—Right

ITEM	DESCRIPTION	TORQUE
1	Cover Fasteners	12 N·m (105 in. lbs.)

- (3) Tighten cylinder head cover bolts and double ended studs to 12 N·m (105 in. lbs).
- (4) Install right rear breather tube and filter assembly.
- (5) Connect injector, ignition coil electrical connectors and harness retaining clips.
- (6) Install the oil fill tube.
- (7) Install PCV hose.
- (8) Install heater hoses.
- (9) Install air conditioning compressor retaining bolts.
- (10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (11) Fill Cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (12) Install air cleaner assembly, resonator assembly and air inlet hose.
- (13) Connect battery negative cable.

INTAKE/EXHAUST VALVES & SEATS

DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. Each valve is actuated by a roller rocker arm which pivots on a stationary lash adjuster. All valves use three bead lock keepers to retain the springs and promote valve rotation.

INTAKE/EXHAUST VALVES & SEATS (Continued)

STANDARD PROCEDURE—REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(1) Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in.).

(2) Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

(3) When the seat is properly positioned the width of the intake seat must be 1.75 – 2.36 mm (0.0689 – 0.0928 in.) and the exhaust seat must be 1.71 – 2.32 mm (0.0673 – 0.0911 in.).

(4) Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 41.44 mm (1.6315 in.).

(5) The valve seat and valve face must maintain a face angle of 44.5 – 45 degrees angle (Fig. 39).

REMOVAL

NOTE: The cylinder heads must be removed in order to preform this procedure.

(1) Using Special Tool 8516 Valve Spring Compressor, remove the rocker arms and the hydraulic lash adjusters (Fig. 40).

(2) Remove the camshaft bearing caps and the camshaft.

NOTE: All eight valve springs and valves are removed in the same manner; this procedure only covers one valve and valve spring.

(3) Using Special Tool C-3422-B or C-3422-C Valve Spring Compressor and Special tool 8519 Adapter, compress the valve spring.

NOTE: It may be necessary to tap the top of the valve spring to loosen the spring retainers locks enough to be removed.

- (4) Remove the two spring retainer lock halves.

NOTE: the valve spring is under tension use care when releasing the valve spring compressor.

- (5) Remove the valve spring compressor.
(6) Remove the spring retainer, and the spring.

NOTE: Check for sharp edges on the keeper grooves. Remove any burrs from the valve stem before removing the valve from the cylinder head.

- (7) Remove the valve from the cylinder head.

NOTE: The valve stem seals are common between intake and exhaust.

- (8) Remove the valve stem seal. Mark the valve for proper installation.

9209-37

Fig. 41 Testing Valve Springs

1 - SPECIAL TOOL C-647

TESTING VALVE SPRINGS

NOTE: Whenever the valves are removed from the cylinder head it is recommended that the valve springs be inspected and tested for reuse.

Inspect the valve springs for physical signs of wear or damage. Turn table of tool C-647 until surface is in line with the 40.69 mm (1.602 in.) mark on the threaded stud and the zero mark on the front. Place spring over the stud on the table and lift compressing lever to set tone device. Pull on torque wrench until Ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Specifications Section to obtain specified height and allowable tensions. Replace any springs that do not meet specifications. (Fig. 41)

INSTALLATION

- (1) coat the valve stem with clean engine oil and insert it into the cylinder head.

- (2) Install the valve stem seal. make sure the seal is fully seated and that the garter spring at the top of the seal is intact.

- (3) Install the spring and the spring retainer (Fig. 42).

- (4) Using the valve spring compressor, compress the spring and install the two valve spring retainer halves.

- (5) Release the valve spring compressor and make sure the two spring retainer halves and the spring retainer are fully seated.

- (6) lubricate the camshaft journal with clean engine oil then Position the camshaft (with the sprocket dowel on the left camshaft at 11 o'clock and the right camshaft at 12 o'clock), then position the camshaft bearing caps.

INTAKE/EXHAUST VALVES & SEATS (Continued)

(7) Install the camshaft bearing cap retaining bolts. Tighten the bolts 9–13 N·m (100 in. lbs.) in ½ turn increments in the sequence shown (Fig. 43).

80b6b398

Fig. 43 Camshaft Bearing Caps Tightening Sequence

(8) Position the hydraulic lash adjusters and rocker arms (Fig. 24).

ROCKER ARM / ADJUSTER ASSEMBLY

DESCRIPTION

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 2.8 mm (0.11 inch) oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

NOTE: Disconnect the battery negative cable to prevent accidental starter engagement.

(1) Remove the cylinder head cover. Refer to Cylinder Head Cover in this section.

(2) For rocker arm removal on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(3) For rocker arm removal on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(4) For rocker arm removal on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

(5) For rocker arm removal on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(6) Using special tool 8516 press downward on the valve spring, remove rocker arm (Fig. 44).

- 2 - SPECIAL TOOL 8516

INSTALLATION

CAUTION: Make sure the rocker arms are installed with the concave pocket over the lash adjusters. Failure to do so may cause severe damage to the rocker arms and/or lash adjusters.

NOTE: Coat the rocker arms with clean engine oil prior to installation.

(1) For rocker arm installation on cylinders 3 and 5 Rotate the crankshaft until cylinder #1 is at TDC exhaust stroke.

(2) For rocker arm installation on cylinders 2 and 8 Rotate the crankshaft until cylinder #1 is at TDC compression stroke.

(3) For rocker arm installation on cylinders 4 and 6 Rotate the crankshaft until cylinder #3 is at TDC compression stroke.

ROCKER ARM / ADJUSTER ASSEMBLY (Continued)

(4) For rocker arm installation on cylinders 1 and 7 Rotate the crankshaft until cylinder #2 is at TDC compression stroke.

(5) Using special tool 8516 press downward on the valve spring, install rocker arm (Fig. 28).

(6) Install the cylinder head cover.

VALVE SPRINGS

DESCRIPTION

The valve springs are made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. The valve spring seat is integral with the valve stem seal, which is a positive type seal to control lubrication.

VALVE STEM SEALS

DESCRIPTION

The valve stem seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

ENGINE BLOCK

DESCRIPTION

The cylinder block is made of cast iron. The block is a closed deck design with the left bank forward. To provide high rigidity and improved NVH an enhanced compacted graphite bedplate is bolted to the block. The block design allows coolant flow between the cylinders bores, and an internal coolant bypass to a single poppet inlet thermostat is included in the cast aluminum front cover.

STANDARD PROCEDURE—CYLINDER BORE HONING

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823, equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880, or a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 45).

Fig. 45 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

ENGINE BLOCK (Continued)

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer (Fig. 46).

805dd884

Fig. 46 Bore Gauge—Typical

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 49.5 MM
(1-15/16 in)

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional readings.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

CONNECTING ROD BEARINGS**STANDARD PROCEDURE—CONNECTING ROD BEARING FITTING**

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 47) (Fig. 48). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 49). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

**HEAVIER WEAR
PATTERN ON
LOWER INSERT**

8086fd05

Fig. 47 Connecting Rod Bearing Inspection

- 1 - UPPER BEARING HALF
- 2 - MATING EDGES
- 3 - GROOVES CAUSED BY ROD BOLTS SCRATCHING JOURNAL DURING INSTALLATION
- 4 - WEAR PATTERN — ALWAYS GREATER ON UPPER BEARING
- 5 - LOWER BEARING HALF

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to

CONNECTING ROD BEARINGS (Continued)

J8909-128

Fig. 48 Locking Tab Inspection

1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

J8909-129

Fig. 49 Scoring Caused by Insufficient Lubrication or Damaged Crankshaft Journal

any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

- (1) Wipe the oil from the connecting rod journal.
- (2) Lubricate the upper bearing insert and install in connecting rod.
- (3) Use piston ring compressor and Guide Pins Special Tool 8507 (Fig. 50) to install the rod and piston assemblies. The oil slinger slots in the rods must face front of the engine. The "F" 's near the piston wrist pin bore should point to the front of the engine.
- (4) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.
- (5) Install bearing cap and connecting rod on the journal and tighten bolts to 27 N-m (20 ft. lbs.) plus a 90° turn. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

80b77088

Fig. 50 Piston and Connecting Rod—Installation

- 1 - "F" TOWARD FRONT OF ENGINE
- 2 - OIL SLINGER SLOT
- 3 - RING COMPRESSOR
- 4 - SPECIAL TOOL 8507

(6) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 51). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

(7) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(8) If bearing-to-journal clearance exceeds the specification, determine which services bearing set to use the bearing sizes are as follows:

CONNECTING ROD BEARINGS (Continued)

J9009-42

Fig. 51 Measuring Bearing Clearance with Plastigage

- 1 - PLASTIGAGE SCALE
2 - COMPRESSED PLASTIGAGE

Bearing Mark	SIZE	USED WITH JOURNAL SIZE
.025 US	.025 mm (.001 in.)	50.983-50.967 mm (2.0073-2.0066 in.)
Std.	STANDARD	50.992-51.008 mm (2.0076-2.0082 in.)
.250 US	.250 mm (.010 in.)	50.758-50.742 mm (1.9984-1.9978 in.)

(9) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(10) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 27 N·m (20 ft. lbs.) plus a 90° turn.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 52). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a crossshaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by five select fit main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft

9009-51 /

Fig. 52 Checking Connecting Rod Side Clearance—Typical

are cross drilled to improve rod bearing lubrication. The number eight counterweight has provisions for crankshaft position sensor target wheel mounting. The select fit main bearing markings are located on the rear side of the target wheel. The crankshaft oil seals are one piece design. The front oil seal is retained in the timing chain cover, and the rear seal is pressed in to a bore formed by the cylinder block and the bedplate assembly.

STANDARD PROCEDURE - CRANKSHAFT END PLAY

- (1) Mount a dial indicator to front of engine with the locating probe on nose of crankshaft (Fig. 53).
- (2) Move crankshaft all the way to the rear of its travel.
- (3) Zero the dial indicator.
- (4) Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

9009-53

Fig. 53 Checking Crankshaft End Play—Typical

CRANKSHAFT (Continued)

REMOVAL

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

(1) Remove the engine. (Refer to 9 - ENGINE - REMOVAL).

(2) Remove the engine oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).

CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan. The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when removing oil pan. Gasket can not be removed with oil pan.

(3) Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

(4) Remove the oil pump pickup tube and oil pan gasket /windage tray.

(5) Remove the bedplate mounting bolts. Note the location of the three stud bolts for installation.

(6) Remove the connecting rods from the crankshaft.

CAUTION: The bedplate to cylinder block mating surface is a critical sealing surface. Do not pry on or damage this surface in anyway.

NOTE: The bedplate contains the lower main bearing halves. Use care when handling bedplate as not to drop or damage bearing halves. Installing main bearing halves in the wrong position will cause sever damage to the crankshaft.

NOTE: The bedplate has pry points cast into it. Use these points only. The pry points are on both the left and right sides, only the left side is shown.

(7) Carefully pry on the pry points (Fig. 54) to loosen the bedplate then remove the bedplate.

CAUTION: When removing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

(8) Remove the crankshaft.

(9) Remove the crankshaft target wheel.

INSPECTION

NOTE: Thoroughly inspect the connecting rod bearing bores and main bearing bores for scoring, blueing or severe scratches. Further disassembly may be required.

80c07275

Fig. 54 Bedplate Pry Point Location

- 1 - CYLINDER BLOCK
- 2 - BEDPLATE
- 3 - PRY POINT

If connecting rod bearing bores show damage, the cylinder heads must be removed to service the piston and rod assemblies. If the bedplate or the cylinder block main bearing bores show damage the engine must be replaced.

(1) If required, remove the main bearing halves from the cylinder block and bedplate.

(2) Thoroughly clean the bedplate to cylinder block sealing surfaces and main bearing bores. Remove all oil and sealant residue.

(3) Inspect the bedplate main bearing bores for cracks, scoring or severe blueing. If either condition exists the engine must be replaced.

(4) Inspect the crankshaft thrust washer for scoring, scratches or blueing. If either condition exist replace the thrust washer.

(5) Inspect the oil pan gasket/windage tray for splits, tears or cracks in the gasket sealing surfaces. Replace gasket as necessary.

INSTALLATION

CAUTION: Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) for proper bearing selections.

CRANKSHAFT (Continued)

(1) Lubricate upper main bearing halves with clean engine oil.

CAUTION: When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

NOTE: Apply sealant to the target wheel retaining screws prior to installation.

(2) Install the crankshaft target wheel. Torque the mounting screws to 22 N·m (21 ft. lbs.).

(3) Position crankshaft in cylinder block.

(4) Install the thrust washers (Fig. 55).

80b77054

Fig. 55 Crankshaft Thrust Washer Installation

1 - CRANKSHAFT THRUST WASHER

CAUTION: The bedplate to cylinder block mating surface must be coated with sealant prior to installation. Failure to do so will cause severe oil leaks.

NOTE: The installation time to install the bedplate after the sealant has been applied is critical.

NOTE: Make sure that the bedplate and cylinder block sealing surfaces are clean and free of oil or other contaminants. Contaminants on the sealing surfaces may cause main bearing distortion and/or oil leaks.

(5) Apply a 2.5mm (0.100 inch) (Fig. 56) bead of Mopar® Gen II Silicone Rubber Adhesive sealant to the cylinder block-to-bedplate mating surface as shown (Fig. 57).

80b897e0

1 - CUT HERE

80ba77f6

Fig. 57 Cylinder Block-to-Bedplate Sealant Bead Location

1 - CYLINDER BLOCK
2 - SEALANT BEAD LOCATION

(6) Coat the crankshaft main bearing journals with clean engine oil and position the bedplate onto the cylinder block.

NOTE: Lubricate the bedplate retaining bolts with clean engine oil prior to installation.

(7) Install the bedplate retaining bolts, making sure to place the stud bolts in the correct location, Torque the bolts in the sequence shown (Fig. 58).

- Tighten bolts **A - L** to 54 N·m (40 ft. lbs.)
- Tighten bolts **1-10** to 2.8 N·m (25 in. lbs.)
- Turn bolts **1-10** an additional 90°.

CRANKSHAFT (Continued)

- Tighten bolts **A1- A6** to 27 N·m (20 ft. lbs.)

Fig. 58 Bedplate Tightening Sequence

- 1 - BEDPLATE
2 - CYLINDER BLOCK

(8) Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

(9) Install the connecting rods and measure side clearance. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

(10) Position the oil pan gasket/windage tray, using a new o-ring, install the oil pickup tube. Torque the bolt to 28N·m (20 ft. lbs.) torque the nuts to 28N·m (20 ft. lbs.).

(11) Install the oil pan. Torque the retaining bolts to 15 N·m (11 ft. lbs.) in the sequence shown (Fig. 59).

(12) Install the engine (Refer to 9 - ENGINE - INSTALLATION).

Fig. 59 Oil Pan Tightening Sequence

CRANKSHAFT MAIN BEARINGS

STANDARD PROCEDURE—CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft position sensor target wheel has grade identification marks stamped into it (Fig. 60). These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5. The crankshaft position sensor target wheel is mounted to the number 8 counter weight on the crankshaft.

Fig. 60 Main Bearing Markings on Target Wheel

- 1 - REARMOST CRANKSHAFT COUNTER WEIGHT
- 2 - TARGET WHEEL
- 3 - MAIN BEARING SELECT FIT MARKINGS

NOTE: Service main bearings are coded. These codes identify what size (grade) the bearing is.

MAIN BEARING SELECTION CHART—4.7L

GRADE MARKING	SIZE mm (in.)	FOR USE WITH JOURNAL SIZE
A	0.008 mm U/S (0.0004 in.) U/S	63.488–63.496 mm (2.4996–2.4999 in.)
B	NOMINAL	63.496–63.504 mm (2.4999–2.5002 in.)
C	0.008 mm O/S (0.0004 in.) O/S	63.504–63.512 mm (2.5002–2.5005 in.)

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 61).

Fig. 61 Main Bearing Wear Patterns

- 1 - UPPER INSERT
- 2 - NO WEAR IN THIS AREA
- 3 - LOW AREA IN BEARING LINING
- 4 - LOWER INSERT

NOTE: If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

CRANKSHAFT MAIN BEARINGS (Continued)

Replace all damaged or worn bearing inserts.

CRANKSHAFT OIL SEAL - FRONT

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (3) Remove A/C compressor mousing fasteners and set aside.
- (4) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (5) Remove upper radiator hose.
- (6) Disconnect electrical connector for fan mounted inside radiator shroud.
- (7) Remove radiator shroud attaching fasteners.

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

- (8) Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
- (9) Remove crankshaft damper bolt.
- (10) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 62).

80b6b292

Fig. 62 Crankshaft Damper—Removal

- 1 - SPECIAL TOOL 8513 INSERT
2 - SPECIAL TOOL 1026

- (11) Using Special Tool 8511, remove crankshaft front seal (Fig. 63).

80b6b290

Fig. 63 Crankshaft Front Seal—Removal

- 1 - SPECIAL TOOL 8511

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

CRANKSHAFT OIL SEAL - FRONT (Continued)

(1) Using Special Tool 8348 and 8512, install crankshaft front seal (Fig. 64).

Fig. 64 Crankshaft Front Seal—Installation

- 1 - TIMING CHAIN COVER
- 2 - SPECIAL TOOL 8348
- 3 - SPECIAL TOOL 8512

(2) Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(3) Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(4) Install upper radiator hose.

(5) Install A/C compressor and tighten fasteners to 54 N·m (40 ft. lbs.).

(6) Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(7) Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(8) Connect negative cable to battery.

CRANKSHAFT OIL SEAL - REAR

REMOVAL

NOTE: This procedure can be preformed in vehicle.

(1) If being preformed in vehicle, remove the transmission.

(2) Remove the flexplate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).

NOTE: The crankshaft oil seal **CAN NOT** be reused after removal.

NOTE: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.

(3) Using Special Tool 8506 (Fig. 65), remove the crankshaft rear oil seal.

Fig. 65 Crankshaft Rear Oil Seal Removal

- 1 - REAR CRANKSHAFT SEAL
- 2 - SPECIAL TOOL 8506

INSTALLATION

(1) Position the magnetic seal guide Special Tool 8349-2 (Fig. 66) onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

(2) Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle (Fig. 67), with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

(3) Install the flexplate.

(4) If removed, install the transmission.

FLEX PLATE

REMOVAL

(1) Remove the transmission.

(2) Remove the bolts and flexplate.

FLEX PLATE (Continued)

Fig. 66 Crankshaft Rear Oil Seal Guide Special Tool 8349-2 and Oil

- 1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-2 GUIDE

Fig. 67 Crankshaft Rear Oil Seal Installation

- 1 - REAR CRANKSHAFT SEAL
2 - SPECIAL TOOL 8349-1 INSTALLER
3 - SPECIAL TOOL C-4171 HANDLE

INSTALLATION

- (1) Position the flexplate onto the crankshaft and install the bolts hand tight.
- (2) Tighten the flexplate retaining bolts to 60 N·m (45 ft. lbs.) in the sequence shown (Fig. 68).
- (3) Install the transmission.

Fig. 68 Flexplate Tightening Sequence

- 1 - FLEXPLATE

PISTON & CONNECTING ROD

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. The anodized top ring groove and crown has been replaced with a coated top ring that is blue in color. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The connecting rods are made of forged powdered metal, with a "fractured cap" design. A pressed fit piston pin is used to attach the piston and connecting rod.

STANDARD PROCEDURE—PISTON FITTING

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 49.5 mm (1-15/16 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 70).

PISTON & CONNECTING ROD (Continued)

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. Tin coated pistons should not be used as replacements for coated pistons.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 69). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

80aac2ao

Fig. 69 Moly Coated Piston

- 1 - MOLY COATED
- 2 - MOLY COATED

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the following components:
 - Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
 - Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
 - Timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
 - Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- (3) If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons

805dd884

Fig. 70 Bore Gauge—Typical

- 1 - FRONT
- 2 - BORE GAUGE
- 3 - CYLINDER BORE
- 4 - 49.5 MM
(1-15/16 in)

from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

- (4) Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool (Fig. 71).

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

- (5) Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

PISTON & CONNECTING ROD (Continued)

Fig. 71 Identify Connecting Rod to Cylinder Position—Typical

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur

(6) Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.

(7) Carefully remove piston rings from piston(s), starting from the top ring down.

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

(1) Using a suitable cleaning solvent clean the pistons in warm water and towel dry.

(2) Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring. Refer to Connecting Rod Bearings in the Service Procedures portion of this Section.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. Refer to Fitting Pistons in the Service Procedures portion of this Section.

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

(1) Before installing piston and connecting rod assemblies into the bore, install the piston rings.

(2) Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**

(3) Position bearing onto connecting rod. Ensure that hole in bearing shell aligns with hole in connecting rod. Lubricate bearing surface with clean engine oil.

(4) Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads (Fig. 72).

80b77088

Fig. 72 Piston and Connecting Rod—Installation

- 1 - "F" TOWARD FRONT OF ENGINE
- 2 - OIL SLINGER SLOT
- 3 - RING COMPRESSOR
- 4 - SPECIAL TOOL 8507

(5) The pistons are marked on the piston pin bore surface with an raised "F" indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks. The connecting rod oil slinger slot faces the front of the engine (Fig. 73).

(6) Wipe cylinder bore clean and lubricate with engine oil.

PISTON & CONNECTING ROD (Continued)

**Fig. 73 Piston and Connecting Rod Orientation**

- 1 - MAJOR THRUST SIDE OF PISTON
2 - OIL SLINGER SLOT

(7) Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.

(8) Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.

(9) Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) plus 90°.

(10) Install the following components:

- Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
- Timing chain and cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
- Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

(11) Fill crankcase with proper engine oil to correct level.

(12) Connect negative cable to battery.

PISTON RINGS

STANDARD PROCEDURE—PISTON RING - FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

- (1) Wipe the cylinder bore clean.
- (2) Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

(3) Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.

(4) Using a feeler gauge check the ring end gap (Fig. 74). Replace any rings not within specification.

**Fig. 74 Ring End Gap Measurement - Typical**

- 1 - FEELER GAUGE

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

(5) Measure the ring side clearance as shown (Fig. 75) make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

(6) Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RINGS (Continued)

**Fig. 75 Measuring Piston Ring Side Clearance**

1 - FEELER GAUGE

PISTON RING SPECIFICATION CHART

Ring Position	Groove Clearance	Maximum Clearance
Upper Ring	.051-.094mm (0.0020- .0037 in.)	0.11mm (0.004 in.)
Intermediate Ring	0.04-0.08mm (0.0016-0.0031 in.)	0.10mm (0.004 in.)
Oil Control Ring (Steel Rails)	.019-.229mm (.0007-.0090 in.)	.25mm (0.010 in.)
Ring Position	Ring Gap	Wear Limit
Upper Ring	0.20-0.36mm (0.008-0.014 in.)	0.40mm (0.0016in.)
Intermediate Ring	0.37-0.63mm (0.014-0.025 in.)	0.71mm (0.028in.)
Oil Control Ring (Steel Rail)	0.025-0.76mm (0.010- 0.030 in.)	1.52mm (0.060in.)

(7) The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- Oil ring expander.
- Upper oil ring side rail.
- Lower oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

(8) Install the oil ring expander.

(9) Install upper side rail (Fig. 76) by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

(10) Install No. 2 intermediate piston ring using a piston ring installer (Fig. 77).

(11) Install No. 1 upper piston ring using a piston ring installer (Fig. 77).

(12) Position piston ring end gaps as shown in (Fig. 78). It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

**Fig. 76 Side Rail—Installation**

1 - SIDE RAIL END

VIBRATION DAMPER

REMOVAL

(1) Disconnect negative cable from battery.

(2) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

NOTE: Transmission cooler line snaps into shroud lower right hand corner.

VIBRATION DAMPER (Continued)

Fig. 77 Upper and Intermediate Rings—Installation

Fig. 78 Piston Ring End Gap Position

- 1 - SIDE RAIL UPPER
- 2 - NO. 1 RING GAP
- 3 - PISTON PIN
- 4 - SIDE RAIL LOWER
- 5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

- (3) Remove crankshaft damper bolt.
- (4) Remove damper using Special Tools 8513 Insert and 1026 Three Jaw Puller (Fig. 79).

Fig. 79 Crankshaft Damper—Removal

- 1 - SPECIAL TOOL 8513 INSERT
- 2 - SPECIAL TOOL 1026

INSTALLATION

CAUTION: To prevent severe damage to the Crankshaft, Damper or Special Tool 8512, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

(1) Align crankshaft damper slot with key in crankshaft. Slide damper onto crankshaft slightly.

CAUTION: Special Tool 8512A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

VIBRATION DAMPER (Continued)

(2) Assemble Special Tool 8512-A as follows. The nut is threaded onto the shaft first. Then the roller bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod (Fig. 80). Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

Fig. 80 Proper Assembly Method for Special Tool 8512-A

- 1 - BEARING
- 2 - NUT
- 3 - THREADED ROD
- 4 - BEARING HARDENED SURFACE (FACING NUT)
- 5 - HARDENED WASHER

(3) Using Special Tool 8512A, press damper onto crankshaft (Fig. 81).

(4) Install then tighten crankshaft damper bolt to 175 N·m (130 ft. lbs.).

(5) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

(6) Connect negative cable to battery.

STRUCTURAL COVER

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine bedplate.

OPERATION

The structural cover provides additional power-train stiffness and reduces noise and vibration.

REMOVAL

- (1) Raise vehicle on hoist.

Fig. 81 Crankshaft Damper Installation

1 - SPECIAL TOOL 8512A

(2) Remove the left hand exhaust pipe from exhaust manifold.

(3) Loosen the right hand exhaust manifold-to-exhaust pipe retaining bolts.

(4) Remove the eight bolts retaining structural cover (Fig. 82).

(5) Pivot the exhaust pipe downward and remove the structural cover.

Fig. 82 Structural Cover

INSTALLATION

CAUTION: The structural cover must be installed as described in the following steps. Failure to do so will cause severe damage to the cover.

STRUCTURAL COVER (Continued)

- (1) Position the structural cover in the vehicle.
- (2) Install all four bolts retaining the cover-to-engine. DO NOT tighten the bolts at this time.
- (3) Install the four cover-to-transmission bolts. Do NOT tighten at this time.

CAUTION: The structural cover must be held tightly against both the engine and the transmission bell housing during tightening sequence. Failure to do so may cause damage to the cover.

- (4) Starting with the two rear cover-to-engine bolts, tighten bolts (1) (Fig. 83) to 54 N·m (40 ft. lbs.), then tighten bolts (2) (Fig. 83) and (3) to 54 N·m (40 ft. lbs.) in the sequence shown.

Fig. 83 Structural Cover

- (5) Install the exhaust pipe on left hand exhaust manifold.
- (6) Tighten exhaust manifold-to-exhaust pipe retaining bolts to 20–26 N·m (15–20 ft. lbs.).

FRONT MOUNT

REMOVAL

- (1) Disconnect the negative cable from the battery.

CAUTION: Remove the fan blade, fan clutch and fan shroud before raising engine. Failure to do so may cause damage to the fan blade, fan clutch and fan shroud.

- (2) Remove the engine oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).
- (3) Support the engine with a suitable jack and a block of wood across the full width of the engine oil pan.
- (4) Remove the four cylinder block-to-insulator mount bolts and the nut from the engine insulator mount through bolt (Fig. 84) (Fig. 85)

Fig. 84 Engine Insulator Mount—Left

- 1 - LOCK NUT (1 PER SIDE)
2 - BOLT (4 PER SIDE)

- (5) Using the jack, raise the engine high enough to remove the engine insulator mount through bolt and the insulator mount.

INSTALLATION

- (1) Position the insulator mount and install the insulator mount through bolt.
- (2) Lower the engine until the four cylinder block-to-insulator mount bolts can be installed.
- (3) Remove the jack and block of wood.
- (4) Torque the cylinder block-to-insulator mount bolts to 61N·m (45 ft. lbs.).
- (5) Install and torque the through bolt retaining nut to 61N·m (45 ft. lbs.).

REAR MOUNT

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Using a suitable jack, support transmission.
- (3) Remove the lock nut from the insulator mount through bolt and the four insulator-to-transmission mounting bolts.
- (4) Raise the transmission enough to remove the through bolt and insulator mount (Fig. 86) (Fig. 87).

REAR MOUNT (Continued)

**Fig. 85 Engine Insulator Mount—Right**

- 1 - LOCK NUT (1 PER SIDE)
2 - BOLT (4 PER SIDE)

**Fig. 86 Engine Rear Mount—4X2****Fig. 87 Engine Rear Mount—4X4**

ITEM	DESCRIPTION	TORQUE
1	NUT (Qty 1)	45 N·m (33 ft. lbs)
2	BOLT (Qty 4)	46 N·m (34 ft. lbs.)
3	BOLT (Qty 2 Per Side)	68 N·m (50 ft. lbs.)
4	BOLT (Qty 2 Per Side)	46 N·m (34 ft. lbs.)
5	BOLT (Qty 4)	46 N·m (34 ft. lbs.)

INSTALLATION

- (1) Position the insulator mount and install the through bolt.
- (2) Lower the transmission enough to install the four insulator-to-transmission mounting bolts. Torque the bolts to 46 N·m (34 ft. lbs.).
- (3) Install the through bolt lock nut. Torque nut to 68 N·m (50 ft. lbs.).
- (4) Remove jack, lower vehicle.

LUBRICATION

DESCRIPTION

The lubrication system (Fig. 88) is a full flow filtration pressure feed type.

80b3c714

Fig. 88 Engine Oil Lubrication System

| 5 - OIL PUMP OUTLET TO BLOCK | 11 - OIL FEED TO BOTH SECONDARY TENSIONERS |
| 6 - OIL PUMP | |

LUBRICATION (Continued)

OPERATION

Oil from the oil pan is pumped by a gerotor type oil pump directly mounted to the crankshaft nose. Oil pressure is controlled by a relief valve mounted inside the oil pump housing. For lubrication flow refer to (Fig. 88).

The camshaft exhaust valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Due to the orientation of the rocker arm, the camshaft intake

lobes are not lubed in the same manner as the exhaust lobes. The intake lobes are lubed through internal passages in the camshaft. Oil flows through a bore in the number 3 camshaft bearing bore, and as the camshaft turns, a hole in the camshaft aligns with the hole in the camshaft bore allowing engine oil to enter the camshaft tube. The oil then exits through 1.6mm (0.063 in.) holes drilled into the intake lobes, lubricating the lobes and the rocker arms.

ENGINE LUBRICATION FLOW CHART—BLOCK: TABLE 1

Main Oil Gallery (drilled through head from rear to front)	1. Base of Camshaft Towers 2. Lash Adjuster Towers
Base of Camshaft Towers	Vertical Drilling Through Tower to Camshaft Bearings**
Lash Adjuster Towers	Diagonal Drillings to Hydraulic Lash Adjuster Pockets
** The number three camshaft bearing journal feeds oil into the hollow camshaft tubes. Oil is routed to the intake lobes, which have oil passages drilled into them to lubricate the rocker arms.	

DIAGNOSIS AND TESTING—ENGINE OIL PRESSURE

(1) Remove oil pressure sending unit (Fig. 89) and install gauge assembly C-3292.

(2) Run engine until thermostat opens.

(3) Oil Pressure:

- Curb Idle—25 Kpa (4 psi) minimum

- 3000 rpm—170 - 550 KPa (25 - 80 psi)

(4) If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

LUBRICATION (Continued)

**Fig. 89 Oil Pressure Sending Unit**

- 1 - BELT

- 3 - OIL FILTER
- 4 - ELEC. CONNECTOR

DIAGNOSIS AND TESTING—REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.
- (4) If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.

(7) After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

DIAGNOSIS AND TESTING—ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

- (1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
- (2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
- (3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.
- (4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat inspection.
- (4) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

Air Leak Detection Test Method

- (1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.
- (2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

LUBRICATION (Continued)

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

- (1) Disconnect the battery.
- (2) Raise the vehicle.
- (3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - (a) Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - (b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
- (4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

OIL

STANDARD PROCEDURE—ENGINE OIL

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR® provides engine oils that conform to this service grade.

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-30 or 10W-30 in the 4.7L engines. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 90).

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

OIL (Continued)

Fig. 90 Temperature/Engine Oil Viscosity—4.7L Engine

CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 91).

9400-9

Fig. 91 Engine Oil Container Standard Notations

OIL LEVEL INDICATOR (DIPSTICK)

The engine oil level indicator is located on the right side of the the 4.7L engine. (Fig. 92).

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.

80b76f24

Fig. 92 Engine Oil Dipstick 4.7L Engine

- 1 - TRANSMISSION DIPSTICK
- 2 - ENGINE OIL DIPSTICK
- 3 - ENGINE OIL FILL CAP

(4) Install dipstick and verify it is seated in the tube.

(5) Remove dipstick, with handle held above the tip, take oil level reading.

(6) Add oil if level is below the SAFE ZONE on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Remove oil fill cap.

(3) Hoist and support vehicle on safety stands.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.

(6) Install drain plug in crankcase.

(7) Remove oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

(8) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.

(9) Install oil fill cap.

OIL (Continued)

- (10) Start engine and inspect for leaks.
- (11) Stop engine and inspect oil level.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

OIL FILTER

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise (Fig. 93) to remove it from the cylinder block oil filter boss.

80b76f81

Fig. 93 Oil Filter - 4.7L Engine

1 - ENGINE OIL FILTER

(4) When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

(5) With a wiping cloth, clean the gasket sealing surface of oil and grime.

INSTALLATION

- (1) Lightly lubricate oil filter gasket with engine oil.
- (2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 94) hand tighten filter one full turn, do not over tighten.
- (3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

Fig. 94 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER

OIL PAN

DESCRIPTION

The engine oil pan is made of laminated steel and has a single plane sealing surface. The sandwich style oil pan gasket has an integrated windage tray and steel carrier. The sealing area of the gasket is molded with rubber and is designed to be reused as long as the gasket is not cut, torn or ripped.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise vehicle on hoist.
- (3) Remove structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
- (4) Remove exhaust system Y-pipe.
- (5) Remove starter (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
- (6) Drain engine oil.
- (7) Un-clip transmission lines from support on oil pan stud. Move lines for oil pan clearance.

CAUTION: DO NOT pry on the oil pan gasket when removing the oil pan. The oil pan gasket is mounted to the cylinder block in three locations and will remain attached to block when lowering oil pan. Gasket can not be removed with oil pan.

OIL PAN (Continued)

- (8) Remove oil pan bolts and oil pan.
- (9) Remove oil pump pickup tube.
- (10) Remove oil pan gasket.

CLEANING

- (1) Clean oil pan in solvent and wipe dry with a clean cloth.
- (2) Clean the oil pan gasket surface. **DO NOT** use a grinder wheel or other abrasive tool to clean sealing surface.
- (3) Clean oil screen and tube thoroughly in clean solvent.

INSPECTION

- (1) Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.
- (2) Inspect the oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

INSTALLATION

- (1) Clean oil pan and all sealing surfaces. Inspect oil pan gasket and replace as necessary.
- (2) Install oil pan gasket.

NOTE: When installing oil pan gasket/windage tray, start four pan bolts at each corner before tightening oil pickup tube. This will keep pan gasket in alignment.

- (3) Install oil pump pick-up tube using a new O-ring. First tighten bolt at O-ring end of tube to 28 N·m (20 ft. lbs.). Tighten remain tube support fasteners to 28 N·m (20 ft. lbs.).

- (4) Install oil pan and tighten fasteners to 15 N·m (11 ft. lbs.) (Fig. 95).

Fig. 95 Oil Pan Tightening Sequence

- (5) Reconnect transmission oil cooler lines to oil pan stud bolt.
- (6) Install starter (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).
- (7) Install exhaust system Y-pipe.

- (8) Install structural cover (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

- (9) Lower vehicle.

- (10) Fill engine with proper amount of oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

- (11) Connect negative cable to battery.

OIL PRESSURE SENSOR/
SWITCH

DESCRIPTION

The 3-wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

REMOVAL

- (1) Disconnect the negative cable from the battery.
- (2) Raise vehicle on hoist.
- (3) Remove front splash shield.
- (4) Disconnect oil pressure sender wire (Fig. 96).

OIL PRESSURE SENSOR/SWITCH (Continued)

- (5) Remove the pressure sender (Fig. 96).

Fig. 96 Oil Pressure Sending Unit

- 1 - BELT
2 - OIL PRESSURE SENSOR
3 - OIL FILTER
4 - ELEC. CONNECTOR

INSTALLATION

- (1) Install oil pressure sender.
- (2) Connect oil pressure sender wire.
- (3) Install front splash shield.
- (4) Lower vehicle.
- (5) Connect the negative battery cable.

OIL PUMP

REMOVAL

- (1) Remove the oil pan and pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
- (2) Remove the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
- (3) Remove the timing chains and tensioners (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
- (4) Remove the four bolts, primary timing chain tensioner and the oil pump.

DISASSEMBLE

- (1) Remove oil pump cover screws and lift off cover plate.
- (2) Remove pump inner and outer rotors.

NOTE: Once the oil pressure relief valve, cup plug, and pin are removed, the pump assembly must be replaced.

- (3) If it is necessary to remove the pressure relief valve, drive the roll pin from pump housing and remove cup plug, spring and valve.

CLEANING

- (1) Wash all parts in a suitable solvent.

INSPECTION

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and removed from the pump the entire oil pump assembly must be replaced.

- (1) Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.

- (2) Lay a straight edge across the pump cover surface (Fig. 97). If a 0.025 mm (0.001 in.) feeler gauge can be inserted between the cover and the straight edge the oil pump assembly should be replaced.

- (3) Measure the thickness of the outer rotor (Fig. 98). If the outer rotor thickness measures at 11.9888 mm (0.472 in.) or less the oil pump assembly must be replaced.

- (4) Measure the diameter of the outer rotor. If the outer rotor diameter measures at 85.928 mm (3.382 in.) or less the oil pump assembly must be replaced.

- (5) Measure the thickness of the inner rotor (Fig. 99). If the inner rotor thickness measures at 11.9888 mm (0.472 in.) or less then the oil pump assembly must be replaced.

- (6) Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body (Fig. 100). If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

- (7) Install the inner rotor into the oil pump body. Measure the clearance between the inner and outer rotors (Fig. 101). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

- (8) Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced (Fig. 102).

OIL PUMP (Continued)

NOTE: 4.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

ASSEMBLE

- (1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.
- (2) Install inner and outer rotors
- (3) Install oil pump cover plate and install cover bolts and tighten them to 12 N·m (105 in. lbs.).
- (4) Prime oil pump before installation by filling rotor cavity with engine oil.

(5) If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other causes for oil pressure loss.

INSTALLATION

- (1) Position the oil pump onto the crankshaft and install two oil pump retaining bolts.
- (2) Position the primary timing chain tensioner and install the two retaining bolts.
- (3) Tighten the oil pump and primary timing chain tensioner retaining bolts to 28 N·m (250 in. lbs.) in the sequence shown (Fig. 103).

**Fig. 103 Oil Pump and Primary Timing Chain Tightening Sequence**

- (4) Install the secondary timing chain tensioners and timing chains (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
- (5) Install the timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
- (6) Install the pick-up tube and oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

INTAKE MANIFOLD**DESCRIPTION**

The intake manifold is made of a composite material and features long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of eight individual press in

INTAKE MANIFOLD (Continued)

place port gaskets to prevent leaks. Eight studs and two bolts are used to fasten the intake to the head.

DIAGNOSIS AND TESTING—INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPM is observed the area of the suspected leak has been found.
- (4) Repair as required.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove air cleaner housing and throttle body resonator (Fig. 104).

Fig. 104 Throttle Body Resonator

- 1 - THROTTLE BODY RESONATOR
- 2 - BOLT
- 3 - BOLT

- (3) Disconnect throttle and speed control cables.
- (4) Disconnect electrical connectors for the following components:

- Manifold Absolute Pressure (MAP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor

(5) Disconnect vapor purge hose, brake booster hose, speed control servo hose, positive crankcase ventilation (PCV) hose.

(6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

(7) Disconnect generator electrical connections.

(8) Unbolt the generator and move it away from the intake manifold for clearance.

(9) Disconnect air conditioning compressor electrical connections.

(10) Unbolt the air conditioning compressor and move it away from the intake manifold for clearance.

(11) Disconnect left and right radio suppressor straps.

(12) Disconnect and remove ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - REMOVAL).

(13) Remove top oil dipstick tube retaining bolt and ground strap.

(14) Bleed pressure from fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).

(15) Remove fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - REMOVAL).

(16) Remove throttle body assembly and mounting bracket.

(17) Drain cooling system below coolant temperature level (Refer to 7 - COOLING - STANDARD PROCEDURE).

(18) Remove coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - REMOVAL).

(19) Remove cowl to hood seal. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/COWL WEATHERSTRIP - REMOVAL).

(20) Remove right side engine lifting stud.

(21) Remove intake manifold retaining fasteners, in

(21) reverse order of tightening sequence (Fig. 105).

NOTE: Intake must be lifted upward and level in the front and rear to clear the cowl. Interference with the cowl will occur during removal.

(22) Remove intake manifold.

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

INTAKE MANIFOLD (Continued)

**Fig. 105 Intake Manifold Tightening Sequence**

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

- (1) Inspect the intake sealing surface for cracks, nicks and distortion.
- (2) Inspect the intake manifold vacuum hose fittings for looseness or blockage.
- (3) Inspect the manifold to throttle body mating surface for cracks, nicks and distortion.

INSTALLATION

- (1) Install intake manifold gaskets.
- (2) Install intake manifold.
- (3) Install intake manifold retaining bolts and tighten in sequence shown in (Fig. 106) to 12 N·m (105 in. lbs.).
- (4) Install left and right radio suppressor straps.
- (5) Install throttle body assembly.
- (6) Install throttle cable bracket.
- (7) Connect throttle cable and speed control cable to throttle body.
- (8) Install fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL RAIL - INSTALLATION).
- (9) Install ignition coil towers (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION COIL - INSTALLATION).
- (10) Install coolant temperature sensor (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT TEMP SENSOR - INSTALLATION).
- (11) Connect electrical connectors for the following components:
 - Manifold Absolute Pressure (MAP) Sensor
 - Intake Air Temperature (IAT) Sensor
 - Throttle Position (TPS) Sensor

**Fig. 106 Intake Manifold Tightening Sequence**

- Coolant Temperature (CTS) Sensor
- Idle Air Control (IAC) Motor
- Ignition coil towers
- Fuel injectors

- (12) Install top oil dipstick tube retaining bolt and ground strap.
- (13) Install right side engine lifting stud.
- (14) Install generator including electrical connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
- (15) Connect Vapor purge hose, Brake booster hose, Speed control servo hose, Positive crankcase ventilation (PCV) hose.
- (16) Install air conditioning compressor including electrical connections.
- (17) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (18) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (19) Install cowl to hood seal (Refer to 23 - BODY/WEATHERSTRIP/SEALS/COWL WEATHERSTRIP - INSTALLATION).
- (20) Install air cleaner housing and throttle body resonator. Tighten resonator bolts 4.5 N·m (40 in. lbs.).
- (21) Connect negative cable to battery.

EXHAUST MANIFOLD - LEFT**DESCRIPTION**

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core

EXHAUST MANIFOLD - LEFT (Continued)

graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

REMOVAL

- (1) Disconnect negative cable for battery.
- (2) Hoist vehicle.
- (3) Disconnect exhaust pipe at manifold.
- (4) Lower vehicle.
- (5) Remove air cleaner housing and tube.
- (6) Remove the front two exhaust heat shield retaining fasteners. Raise vehicle and remove the fasteners at rear of heat shield.
- (7) Remove heat shield (Fig. 107).
- (8) Lower vehicle and remove the upper exhaust manifold retaining bolts (Fig. 107).
- (9) Raise vehicle and remove the lower exhaust manifold retaining bolts (Fig. 107).
- (10) Remove exhaust manifold and gasket (Fig. 107). Manifold is removed from below the engine compartment.

CLEANING

- (1) Clean the exhaust manifold using a suitable cleaning solvent, then allow to air dry.
- (2) Clean all gasket residue from the manifold mating surface.

INSPECTION

- (1) Inspect the exhaust manifold for cracks in the mating surface and at every mounting bolt hole.
- (2) Using a straight edge and a feeler gauge, check the mating surface for warp and twist.
- (3) Inspect the manifold to exhaust pipe mating surface for cracks, gouges, or other damage that would prevent sealing.

INSTALLATION

- (1) Install exhaust manifold and gasket from below engine compartment.
- (2) Install lower exhaust manifold fasteners (Fig. 107). DO NOT tighten until all fasteners are in place.
- (3) Lower vehicle and install upper exhaust manifold fasteners (Fig. 107). Tighten all manifold bolts starting at center and working outward to 25 N·m (18 ft. lbs.).

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

- (4) Install exhaust manifold heat shield (Fig. 107). Tighten fasteners to 8 N·m (72 in. lbs.), then loosen 45 degrees.

- (5) Install air cleaner housing and tube.
- (6) Connect exhaust pipe to manifold.
- (7) Connect negative cable to battery.

EXHAUST MANIFOLD - RIGHT

DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A perforated core graphite exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold.

REMOVAL

- (1) Disconnect negative cable for battery.
- (2) Remove battery from vehicle.
- (3) Remove Power Distribution Center (PDC) fasteners and set aside.
- (4) Remove battery tray assembly.
- (5) Remove washer bottle assembly.
- (6) Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (7) Remove A/C compressor from mounting and set aside.
- (8) Remove A/C accumulator support bracket fastener.
- (9) Drain coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (10) Remove heater hoses at engine.
- (11) Remove fasteners attaching exhaust manifold heat shield (Fig. 108).
- (12) Remove heat shield (Fig. 108).
- (13) Remove upper exhaust manifold attaching fasteners (Fig. 108).
- (14) Raise vehicle on hoist.
- (15) Disconnect exhaust pipe from manifold.
- (16) Remove fasteners attaching starter. Move starter aside.
- (17) Remove lower exhaust manifold attaching fasteners.
- (18) Remove exhaust manifold and gasket (Fig. 108). Manifold is removed from below the engine compartment.

EXHAUST MANIFOLD - RIGHT (Continued)

2	Bolt (Qty 4)	25 N·m (18 ft. lbs.)	5	Nut (Qty 2)	
3	Stud (Qty 2)				

CAUTION: Over tightening heat shield fasteners, may cause shield to distort and/or crack.

- (4) Install exhaust manifold heat shield. Tighten fasteners to 8 N·m (72 in. lbs.), then loosen 45 degrees.
- (5) Install starter and fasteners.
- (6) Connect exhaust pipe to manifold.
- (7) Connect heater hoses at engine.
- (8) Install fastener attaching A/C accumulator.
- (9) Install A/C compressor and fasteners.
- (10) Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

- (11) Install washer bottle and battery tray assembly.
- (12) Install PDC.
- (13) Install battery and connect cables.
- (14) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

VALVE TIMING

DESCRIPTION—TIMING DRIVE SYSTEM

The timing drive system has been designed to provide quiet performance and reliability to support a **non-free wheeling** engine. Specifically the intake

VALVE TIMING (Continued)

valves are non-free wheeling and can be easily damaged with forceful engine rotation if camshaft-to-crankshaft timing is incorrect. The timing drive system consists of a primary chain and two secondary timing chain drives (Fig. 109).

OPERATION—TIMING DRIVE SYSTEM

The primary timing chain is a single inverted tooth type. The primary chain drives the large fifty tooth idler sprocket directly from a 25 tooth crankshaft sprocket. Primary chain motion is controlled by a pivoting leaf spring tensioner arm and a fixed guide. The arm and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication from the secondary chain drive and oil pump leakage. The idler sprocket assembly connects the primary and secondary chain drives. The idler sprocket assembly con-

sists of two integral thirty tooth sprockets and a fifty tooth sprocket that is splined to the assembly. The spline joint is a non – serviceable press fit anti rattle type. A spiral ring is installed on the outboard side of the fifty tooth sprocket to prevent spline disengagement. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the two bushings used in the idler sprocket assembly.

There are two secondary drive chains, both are inverted tooth type, one to drive the camshaft in each SOHC cylinder head. There are no shaft speed changes in the secondary chain drive system. Each secondary chain drives a thirty tooth cam sprocket

80b3c710

Fig. 109 Timing Drive System

| 6 - TWO PLATED LINKS ON RIGHT CAMSHAFT CHAIN | 12 - SECONDARY TENSIONER ARM |

VALVE TIMING (Continued)

directly from the thirty tooth sprocket on the idler sprocket assembly. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The hydraulic tensioners for the secondary chain systems are fed pressurized oil from oil reservoir pockets in the block. Each tensioner also has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The secondary timing chains receive lubrication from a small orifice in the tensioners. This orifice is protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE—ENGINE TIMING VERIFICATION

CAUTION: The 4.7L is a non free-wheeling design engine. Therefore, correct engine timing is critical.

NOTE: Components referred to as left hand or right hand are as viewed from the drivers position inside the vehicle.

NOTE: The blue link plates on the chains and the dots on the camshaft drive sprockets may not line up during the timing verification procedure. The blue link plates are lined up with the sprocket dots only when re-timing the complete timing drive. Once the timing drive is rotated blue link-to-dot alignment is no longer valid.

Engine base timing can be verified by the following procedure:

(1) Remove the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(2) Using a mirror, locate the TDC arrow on the front cover (Fig. 110). Rotate the crankshaft until the mark on the crankshaft damper is aligned with the TDC arrow on the front cover. The engine is now at TDC.

(3) Note the location of the V8 mark stamped into the camshaft drive gears (Fig. 111). If the V8 mark on each camshaft drive gear is at the twelve o'clock position, the engine is at TDC (cylinder #1) on the exhaust stroke. If the V8 mark on each gear is at the six o'clock position, the engine is at TDC (cylinder #1) on the compression stroke.

(4) If both of the camshaft drive gears are off in the same or opposite directions, the primary chain or both secondary chains are at fault. Refer to Timing Chain and Sprockets procedure in this section.

Fig. 110 Engine Top Dead Center (TDC) Indicator Mark

- 1 - TIMING CHAIN COVER
- 2 - CRANKSHAFT TIMING MARKS

(5) If only one of the camshaft drive gears is off and the other is correct, the problem is confined to one secondary chain. Refer to Single camshaft timing, in this procedure.

(6) If both camshaft drive gear V8 marks are at the twelve o'clock or the six o'clock position the engine base timing is correct. Reinstall the cylinder head covers.

SINGLE CAMSHAFT TIMING

NOTE: to adjust the timing on one camshaft, perform the following procedure.

(1) Using Chain Tensioner Wedge, special tool 8350, stabilize the secondary chain drive (Fig. 112). For reference purposes, mark the chain-to-sprocket position (Fig. 112).

(2) Remove the camshaft drive gear retaining bolt.

(3) Carefully remove the camshaft drive gear from the camshaft.

(4) Re-index the camshaft drive gear in the chain until the V8 mark is at the same position as the V8 mark on the opposite camshaft drive gear.

NOTE: When gripping the camshaft, place the pliers on the tube portion of the camshaft only. Do not grip the lobes or the sprocket areas.

VALVE TIMING (Continued)

**Fig. 111 Camshaft Sprocket V8 Marks**

- 1 - LEFT CYLINDER HEAD
2 - RIGHT CYLINDER HEAD

(5) Using a suitable pair of adjustable pliers, rotate the camshaft until the alignment dowel on the camshaft is aligned with the slot in the camshaft drive gear (Fig. 113).

CAUTION: Remove excess oil from camshaft sprocket retaining bolt before reinstalling bolt. Failure to do so may cause over-torqueing of bolt resulting in bolt failure.

(6) Position the camshaft drive gear onto the camshaft, remove oil from bolt then install the retaining bolt. Using Special Tools, Spanner Wrench 6958 with Adapter Pins 8346 and a suitable torque wrench, Tighten retaining bolt to 122N·m (90 ft. Lbs.) (Fig. 114) (Fig. 115).

(7) Remove special tool 8350.

(8) Rotate the crankshaft two full revolutions, then reverify that the camshaft drive gear V8 marks are in fact aligned.

(9) Install the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

STANDARD PROCEDURE—MEASURING TIMING CHAIN WEAR

NOTE: This procedure must be performed with the timing chain cover removed.

(1) Remove the timing chain cover. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(2) To determine if the secondary timing chains are worn, rotate the engine clockwise until maximum tensioner piston extension is obtained. Measure the distance between the secondary timing chain tensioner housing and the step ledge on the piston (Fig. 116). The measurement at point (A) must be less than 15mm (0.5906 inches).

(3) If the measurement exceeds the specification the secondary timing chains are worn and require replacement. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

NOTE: If the secondary chains are to be replaced the primary chain and sprockets must also be replaced.

TIMING BELT / CHAIN COVER(S)

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (3) Disconnect both heater hoses at timing cover.
- (4) Disconnect lower radiator hose at engine.
- (5) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
- (6) Remove accessory drive belt tensioner assembly (Fig. 117).

Fig. 117 Accessory Drive Belt Tensioner

- 1 - TENSIONER ASSEMBLY
- 2 - FASTENER TENSIONER TO FRONT COVER

- (7) Remove the generator and A/C compressor.
- (8) Remove cover and gasket (Fig. 118).

INSTALLATION

- (1) Clean timing chain cover and block surface. Inspect cover gasket and replace as necessary.
- (2) Install cover and gasket. Tighten fasteners in sequence as shown in (Fig. 119) to 54 N·m (40 ft. lbs.).
- (3) Install the A/C compressor and generator.
- (4) Install crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
- (5) Install accessory drive belt tensioner assembly. Tighten fastener to 54 N·m (40 ft. lbs.).

- (6) Install lower radiator hose.
- (7) Install both heater hoses.
- (8) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
- (9) Connect the battery negative cable.

TIMING BELT/CHAIN AND SPROCKETS

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(3) Remove right and left cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

(4) Remove radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

(5) Rotate engine until timing mark on crankshaft damper aligns with TDC mark on timing chain cover (Fig. 120) (#1 cylinder exhaust stroke) and the camshaft sprocket "V8" marks are at the 12 o'clock position (Fig. 121).

Fig. 120 Engine Top Dead Center (TDC) Indicator Mark

- 1 - TIMING CHAIN COVER
2 - CRANKSHAFT TIMING MARKS

(6) Remove power steering pump.

(7) Remove access plugs (2) from left and right cylinder heads for access to chain guide fasteners (Fig. 122).

(8) Remove the oil fill housing to gain access to the right side tensioner arm fastener.

(9) Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

(10) Collapse and pin primary chain tensioner (Fig. 123).

CAUTION: Plate behind left secondary chain tensioner could fall into oil pan. Therefore, cover pan opening.

(11) Remove secondary chain tensioners.

(12) Remove camshaft position sensor from right cylinder head (Fig. 124).

CAUTION: Care should be taken not to damage camshaft target wheel. Do not hold target wheel while loosening or tightening camshaft sprocket. Do not place the target wheel near a magnetic source of any kind. A damaged or magnetized target wheel could cause a vehicle no start condition.

CAUTION: Do not forcefully rotate the camshafts or crankshaft independently of each other. Damaging intake valve to piston contact will occur. Ensure negative battery cable is disconnected to guard against accidental starter engagement.

(13) Remove left and right camshaft sprocket bolts.

(14) While holding the left camshaft steel tube with adjustable pliers, (Fig. 125) remove the left camshaft sprocket. Slowly rotate the camshaft approximately 15 degrees clockwise to a neutral position.

(15) While holding the right camshaft steel tube with adjustable pliers, (Fig. 126) remove the right camshaft sprocket. Slowly rotate the camshaft approximately 45 degrees counterclockwise to a neutral position.

(16) Remove idler sprocket assembly bolt.

(17) Slide the idler sprocket assembly and crank sprocket forward simultaneously to remove the primary and secondary chains.

(18) Remove both pivoting tensioner arms and chain guides.

(19) Remove chain tensioner.

INSPECTION

Inspect the following components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.

- Idler sprocket assembly bushing and shaft for excessive wear.

- Idler sprocket assembly spline joint. The joint should be tight with no backlash or axial movement.

- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep. If plastic face is severely grooved or melted, the tensioner lube jet may be clogged. The tensioner should be replaced.

- secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner and tensioner arm should be replaced.

- Primary chain tensioner plastic faces. Replace as required (Fig. 127).

INSTALLATION

(1) Using a vise, lightly compress the secondary chain tensioner piston until the piston step is flush with the tensioner body. Using a pin or suitable tool, release ratchet pawl by pulling pawl back against spring force through access hole on side of tensioner. While continuing to hold pawl back, Push ratchet device to approximately 2 mm from the tensioner

body. Install Special Tool 8514 lock pin into hole on front of tensioner. Slowly open vise to transfer piston spring force to lock pin (Fig. 128).

(2) Position primary chain tensioner over oil pump and insert bolts into lower two holes on tensioner bracket. Tighten bolts to 28 N·m (250 in. lbs.).

CAUTION: Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(3) Install right side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

NOTE: The silver bolts retain the guides to the cylinder heads and the black bolts retain the guides to the engine block.

(4) Install the left side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

CAUTION: Overtightening the tensioner arm torx® bolt can cause severe damage to the cylinder head. Tighten torx® bolt to specified torque only.

(5) Install left side chain tensioner arm. Apply Mopar® Lock N, Seal to torx® bolt, tighten bolt to 17 N·m (150 in. lbs.).

(6) Install the right side chain guide. Tighten the bolts to 28 N·m (250 in. lbs.).

(7) Install both secondary chains onto the idler sprocket. Align two plated links on the secondary chains to be visible through the two lower openings

TIMING BELT/CHAIN AND SPROCKETS (Continued)

80b3c710

Fig. 127 Timing Chain System

- | | |
|---|--|
| 1 - RIGHT CAMSHAFT SPROCKET AND SECONDARY CHAIN | 7 - PRIMARY CHAIN |
| 2 - SECONDARY TIMING CHAIN TENSIONER (LEFT AND RIGHT SIDE NOT COMMON) | 8 - IDLER SPROCKET |
| 3 - SECONDARY TENSIONER ARM | 9 - CRANKSHAFT SPROCKET |
| 4 - LEFT CAMSHAFT SPROCKET AND SECONDARY CHAIN | 10 - PRIMARY CHAIN TENSIONER |
| 5 - CHAIN GUIDE | 11 - TWO PLATED LINKS ON LEFT CAMSHAFT CHAIN |
| 6 - TWO PLATED LINKS ON RIGHT CAMSHAFT CHAIN | 12 - SECONDARY TENSIONER ARM |

on the idler sprocket (4 o'clock and 8 o'clock). Once the secondary timing chains are installed, position special tool 8515 to hold chains in place for installation (Fig. 129).

(8) Align primary chain double plated links with the timing mark at 12 o'clock on the idler sprocket. Align the primary chain single plated link with the timing mark at 6 o'clock on the crankshaft sprocket (Fig. 127).

(9) Lubricate idler shaft and bushings with clean engine oil.

(10) Install all chains, crankshaft sprocket, and idler sprocket as an assembly (Fig. 130). After guiding both secondary chains through the block and cylinder head openings, affix chains with an elastic strap or the equivalent. This will maintain tension on chains to aid in installation.

NOTE: It will be necessary to slightly rotate camshafts for sprocket installation.

(11) Align left camshaft sprocket "L" dot to plated link on chain.

(12) Align right camshaft sprocket "R" dot to plated link on chain.

CAUTION: Remove excess oil from the camshaft sprocket bolt. Failure to do so can result in over-torque of bolt resulting in bolt failure.

(13) Remove Special Tool 8515, then attach both sprockets to camshafts. Remove excess oil from bolts, then install sprocket bolts, but do not tighten at this time.

(14) Verify that all plated links are aligned with the marks on all sprockets and the "V8" marks on

TIMING BELT/CHAIN AND SPROCKETS (Continued)

80b77052

Fig. 128 Resetting Secondary Chain Tensioners

- 2 - INSERT LOCK PIN
- 3 - RATCHET PAWL
- 4 - RATCHET
- 5 - PISTON

camshaft sprockets are at the 12 o'clock position (Fig. 127).

CAUTION: Ensure the plate between the left secondary chain tensioner and block is correctly installed.

(15) Install both secondary chain tensioners. Tighten bolts to 28 N·m (250 in. lbs.).

NOTE: Left and right secondary chain tensioners are not common.

(16) Before installing idler sprocket bolt, lubricate washer with oil, and tighten idler sprocket assembly retaining bolt to 34 N·m (25 ft. lbs.).

(17) Remove all locking pins (3) from tensioners.

CAUTION: After pulling locking pins out of each tensioner, DO NOT manually extend the tensioner(s) ratchet. Doing so will over tension the chains, resulting in noise and/or high timing chain loads.

(18) Using Special Tool 6958, Spanner with Adaptor Pins 8346, tighten left (Fig. 131) and right (Fig. 132). camshaft sprocket bolts to 122 N·m (90 ft. lbs.).

(19) Rotate engine two full revolutions. Verify timing marks are at the follow locations:

80b77055

Fig. 129 Installing Secondary Timing Chains on Idler Sprocket

- 1 - TORQUE WRENCH
- 2 - CAMSHAFT SPROCKET
- 3 - LEFT CYLINDER HEAD
- 4 - SPECIAL TOOL 6958 SPANNER WITH ADAPTER PINS 8346

- primary chain crankshaft sprocket dot is at 6 o'clock (Fig. 127)

- secondary chain camshaft sprockets "V8" marks are at 12 o'clock (Fig. 127)

(20) Lubricate all three chains with engine oil.

(21) After installing all chains, it is recommended that the idler gear end play be checked (Fig. 133). The end play must be within 0.10–0.25 mm (0.004–0.010 in.). If not within specification, the idler gear must be replaced.

(22) Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) and crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

(23) Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

Fig. 132 Tightening Right Side Camshaft Sprocket Bolt

- 1 - IDLER SPROCKET ASSEMBLY
- 2 - DIAL INDICATOR

NOTE: Before installing threaded plug in right cylinder head, the plug must be coated with sealant to prevent leaks.

TIMING BELT/CHAIN AND SPROCKETS (Continued)

(24) Coat the large threaded access plug with **Mopar® Thread Sealant with Teflon**, then install into the right cylinder head and tighten to 81 N·m (60 ft. lbs.) (Fig. 122).

(25) Install the oil fill housing.

(26) Install access plug in left cylinder head (Fig. 122).

(27) Install power steering pump.

(28) Install radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).

(29) Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

(30) Connect negative cable to battery.

EXHAUST SYSTEM

DESCRIPTION - EXHAUST SYSTEM 4.0L ENGINE

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

The exhaust system uses a single muffler with a welded tailpipe.

The 50 State Emissions vehicles use two mini catalytic converters inline with the exhaust pipe below the exhaust manifolds.

The exhaust manifolds are equipped with ball flange outlets to assure a tight seal and strain free connections.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises originating from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

The basic exhaust system consists of exhaust manifold(s), exhaust pipe with oxygen sensors, catalytic converter(s), heat shield(s), muffler and tailpipe (Fig. 1) and (Fig. 2)

EXHAUST SYSTEM (Continued)

DIAGNOSIS AND TESTING—EXHAUST SYSTEM

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE	1. Leaks at pipe joints. 2. Burned or blown out muffler. 3. Burned or rusted-out exhaust pipe. 4. Exhaust pipe leaking at manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Restriction in muffler or tailpipe. 8. Exhaust system contacting body or chassis.	1. Tighten clamps to specified torque at leaking joints (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS). 2. Replace muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL). Check exhaust system. 3. Replace exhaust pipe (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL). 4. Tighten connection attaching nuts (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS). 5. Replace exhaust manifold (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - REMOVAL). 6. Tighten exhaust manifold to cylinder head stud nuts or bolts (Refer to 9 - ENGINE - SPECIFICATIONS). 7. Remove restriction, if possible. Replace muffler or tailpipe, as necessary. 8. Re-align exhaust system to clear surrounding components.
LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten/replace clamps at leaking joints (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).

CATALYTIC CONVERTER - 4.0L

DESCRIPTION - CATALYTIC CONVERTER 4.0L ENGINE

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

50 State emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter (Fig. 3).

Fig. 3 4.0L Catalytic Converter and O2 Sensor Configuration - 50 State Emissions

CATALYTIC CONVERTER - 4.0L (Continued)

REMOVAL

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove nuts from the catalytic converter and exhaust pipe flange connection (Fig. 4).
- (4) Loosen exhaust clamp from the catalytic converter and muffler connection (Fig. 4).
- (5) Disconnect oxygen sensor wiring (Fig. 4).

Fig. 4 Exhaust Pipe-to-Catalytic Converter-to-Muffler Connection

- 2 - OXYGEN SENSOR
- 3 - MUFFLER
- 4 - CATALYTIC CONVERTER
- 5 - EXHAUST PIPE WITH FLANGE JOINT
- 6 - NUTS (3)

- (6) Heat the catalytic converter to muffler connection with a torch until the metal becomes cherry red.
- (7) While the metal is still cherry red, twist the catalytic converter back and forth to separate it from the exhaust pipe and the muffler (Fig. 5).

Fig. 5 Catalytic Converter—Removal

- 1 - EXHAUST PIPE WITH FLANGE
- 2 - NUTS (3)
- 3 - CATALYTIC CONVERTER

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

INSTALLATION

- (1) Position the catalytic converter onto the exhaust pipe flange connection (Fig. 4). Tighten the nuts to 28 N·m (250 in. lbs.) torque.
- (2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.
- (3) Install the exhaust clamp at the muffler and catalytic converter connection (Fig. 4). Tighten the clamp nuts to 47 N·m (35 ft. lbs.) torque.
- (4) Connect oxygen sensor wiring (Fig. 4).
- (5) Lower the vehicle.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

CATALYTIC CONVERTER - 4.7L

DESCRIPTION - CATALYTIC CONVERTER

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

50 State emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter (Fig. 6).

REMOVAL

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

INSTALLATION

(1) Position the catalytic converter onto the exhaust pipe flange connection (Fig. 4). Tighten the nuts to 28 N·m (250 in. lbs.) torque.

(2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.

(3) Install the exhaust clamp at the muffler and catalytic converter connection (Fig. 4). Tighten the clamp nuts to 47 N·m (35 ft. lbs.) torque.

(4) Connect oxygen sensor wiring (Fig. 4).

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST PIPE - 4.0L

REMOVAL

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Remove the oxygen sensor from the exhaust pipe (Fig. 9).
- (4) Remove the nuts from the exhaust pipe to catalytic converter flange connection (Fig. 10).
- (5) Disconnect the exhaust pipe from the exhaust manifold. (Fig. 11)

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

(3) Coat the oxygen sensor with anti-seize compound. Install the sensor and tighten the nut to 48 N·m (35 ft. lbs.) torque (Fig. 13).

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

(6) After initial start-up, check the engine exhaust manifold to exhaust pipe nuts for proper torque.

HEAT SHIELDS**DESCRIPTION**

Heat shields are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The catalytic

HEAT SHIELDS (Continued)

converter releases additional heat into the exhaust system. Under severe operating conditions, the temperature increases in the area of the converter. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency (Fig. 17).

Fig. 18 Muffler and Tailpipe

- 1 - CATALYTIC CONVERTER
- 2 - TAILPIPE HANGER
- 3 - TAILPIPE
- 4 - MUFFLER

MUFFLER

DESCRIPTION

Both the 4.0L and 4.7L engines use a stainless steel muffler to control exhaust noise levels and exhaust back pressure. The muffler and tailpipe are a one piece assembly (Fig. 18).

REMOVAL

All original equipment exhaust systems are manufactured with the tailpipe welded to the muffler. Service replacement mufflers and tailpipes are either clamped together or welded together.

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
- (3) Loosen the exhaust clamp on the catalytic converter to muffler connection (Fig. 19).
- (4) Heat the catalytic converter-to-muffler connection with a torch until the metal becomes cherry red.
- (5) While the metal is still cherry red, remove the tailpipe/muffler assembly from the catalytic converter.

808c33b3

Fig. 19 Installing Exhaust Clamps

- 1 - CATALYTIC CONVERTER
- 2 - MUFFLER

MUFFLER (Continued)

- (6) Remove the tailpipe from the tailpipe hanger (Fig. 20).
- (7) Remove the tailpipe/muffler assembly (Fig. 20).

INSTALLATION

- (1) If the tailpipe hanger assembly was removed, install the hanger to the frame. Tighten the bolts to 22 N·m (192 in. lbs.) torque.
- (2) Position the tailpipe and muffler onto the tailpipe hanger (Fig. 20) .
- (3) Install the muffler onto the catalytic converter. Make sure that the tailpipe has sufficient clearance from the floor pan. Install exhaust clamp and tighten the nuts to 47 N·m (35 ft. lbs.) torque (Fig. 19) .
- (4) Lower the vehicle.
- (5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

808c335a

TAILPIPE

DESCRIPTION

The tailpipe is also made of stainless steel. (Fig. 18) .

OPERATION

The Tailpipe channels the exhaust out of the muffler and out from under the vehicle to control noise and prevent exhaust gas fumes from entering the passenger compartment

BUMPERS

DESCRIPTION

The bumpers on the Jeep Grand Cherokee are made up of an absorber attached to the unibody frame rails and covered by the front and rear fascia. Some Grand Cherokee models also have a tow hook support bracket fastened to the front unibody rail crossmember.

OPERATION

The bumpers absorb minor impacts and protect exterior sheetmetal components.

FRONT ABSORBER

REMOVAL

(1) Remove front fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

(2) Remove the retainer attaching the absorber to the fascia.

(3) Separate the absorber from the fascia.

INSTALLATION

(1) Position the absorber on the fascia.

(2) Install the retainer attaching the absorber to the fascia.

(3) Install front fascia. Refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

FRONT FASCIA

REMOVAL

(1) Raise and support vehicle.

(2) Turn front wheels to access rivets and remove plastic rivets attaching fascia to wheel liner.

(3) Remove bolts attaching fascia to fender (Fig. 1).

(4) Remove plastic push pin fasteners attaching front fascia to lower radiator crossmember splash shield (Fig. 2).

(5) Disengage fog lamp connectors, if equipped.

(6) Remove screws attaching fascia/grille to upper radiator crossmember (Fig. 3).

(7) Slide fascia forward to separate from vehicle.

INSTALLATION

(1) Slide fascia onto vehicle engaging fascia with tabs on bottom of front fenders.

(2) Install screws attaching fascia/grille to upper radiator crossmember (Fig. 3).

(3) Install bolts attaching fascia to fender (Fig. 1).

(4) Engage fog lamp connectors, if equipped.

(5) Install plastic rivets attaching fascia to wheel liner.

(6) Install plastic push pin fasteners attaching front fascia to lower radiator crossmember splash shield (Fig. 2).

(7) Remove supports and lower vehicle.

REAR ABSORBER

REMOVAL

(1) Remove rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).

(2) Remove rivets attaching absorber to rear cross-member (Fig. 5).

(3) Separate absorber from vehicle.

INSTALLATION

(1) Position absorber on vehicle.

(2) Install rivets attaching absorber to rear cross-member (Fig. 2).

(3) Install rear fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).

REAR FASCIA

REMOVAL

(1) Raise and support vehicle.

(2) Remove wheels.

(3) Remove plastic push pins attaching fascia to fuel tank skid plate.

(4) Remove plastic rivets attaching fascia to wheel liner.

(5) Remove nuts attaching upper edge of fascia to quarter panel and wheel liner (Fig. 4).

REAR FASCIA (Continued)

(6) Remove plastic push pins attaching fascia to liftgate opening (Fig. 5).

(7) Remove screws attaching fascia to liftgate opening.

(8) Remove D pillar trim and scuff plate outboard screws.

(9) Remove the rearward tie down screws and the aperture trim panel.

(10) Carefully peel back the rubber body sealer patch to access the retainer clips.

(11) Release the forward and rearward retainer clips on both sides of the fascia.

(12) Grasp forward edges of fascia and pull outward to disengage retainers attaching fascia to quarter panel (Fig. 6).

(13) Separate fascia from vehicle.

FRAME**DESCRIPTION**

Jeep Grand Cherokee vehicles do not have a conventional frame. They are constructed as a unitized body and frame. Jeep unibodies are constructed from special high strength steel and coated metals. This process reduces weight and provides strength to withstand the forces applied against structural members. The structural members provide a unibody that has great structural strength.

FUEL DELIVERY

DESCRIPTION

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel gauge sending unit (fuel level sensor)

and a separate fuel filter located at bottom of pump module

- a separate combination fuel filter/fuel pressure regulator

- fuel tubes/lines/hoses
- quick-connect fittings
- fuel injector rail

FUEL DELIVERY (Continued)

- fuel injectors
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

OPERATION

The fuel tank assembly consists of: the fuel tank, fuel tank shield, fuel tank straps, fuel pump module assembly, fuel pump module locknut/gasket, and roll-over valve (refer to Emission Control System for roll-over valve information).

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. The fuel filler tube contains a flap door located below the fuel fill cap.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

DIAGNOSIS AND TESTING - FUEL PRESSURE LEAK DOWN TEST

Use this test in conjunction with the Fuel Pump Pressure Test and Fuel Pump Capacity Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

Abnormally long periods of cranking to restart a **hot** engine that has been shut down for a short period of time may be caused by:

- Fuel pressure bleeding past a fuel injector(s).
- Fuel pressure bleeding past the check valve in the fuel pump module.
- A defective fuel filter/pressure regulator.

Two #6539, 5/16", Fuel Line Pressure Test Adapter Hose Tools are required for the following tests.

(1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure.

(2) Raise vehicle.

Fuel Line Identification: The fuel filter/pressure regulator is located in front of the fuel tank and above the rear axle. It is transversely mounted to a chassis crossmember (left-to-right). The filter/regulator is equipped with 3 fuel line fittings (2 at one end and 1 at the other end). The single fitting facing the left side of the vehicle is the supply line to the fuel rail (Fig. 1). The 2 fittings facing the right side of the vehicle are connected to the fuel tank. Of these 2 fittings, the fitting towards the **front** is used for fuel return to the fuel tank. The fitting towards the **rear** is a pressure line. This **rear** fitting must be disconnected for the following step.

(3) See previous step. Disconnect fuel pressure line at **rear** of filter/regulator. This is a 5/16" quick-connect fitting (Fig. 1). Refer to Quick-Connect Fittings for procedures.

80bfe151

(4) Obtain correct Fuel Line Pressure Test Adapter Hose Tool # 6539 for 5/16" fuel lines. Connect one end of this Special Tool into the disconnected fuel

FUEL DELIVERY (Continued)

pressure line. Connect the other end of the Tool into fitting on filter/regulator.

(5) Lower vehicle.

(6) Disconnect the fuel inlet line at fuel rail. Refer to Quick-Connect Fittings for procedures. On some engines, air cleaner housing removal may be necessary before fuel line disconnection.

(7) Obtain a second Fuel Line Pressure Test Adapter Hose Tool # 6539 for 5/16" fuel lines. Connect this tool between disconnected fuel line and fuel rail (Fig. 2).

Fig. 2 Connecting Adapter Tool—Typical

- 1 - VEHICLE FUEL LINE
- 2 - TEST PORT "T"
- 3 - SPECIAL TOOL 6923, 6631, 6541 OR 6539
- 4 - FUEL PRESSURE TEST GAUGE
- 5 - FUEL LINE CONNECTION AT RAIL
- 6 - FUEL RAIL

(8) Connect the 0-414 kPa (0-60 psi) fuel pressure test gauge (from Gauge Set 5069) to the test port on the appropriate Adaptor Tool. **NOTE: The DRB III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

CAUTION: The fittings on both tools must be in good condition and free from any small leaks before performing the proceeding test.

(9) Start engine and bring to normal operating temperature.

(10) Observe fuel pressure test gauge (or DRB screen). Normal operating pressure should be 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi).

(11) Shut engine off.

(12) Pressure should not fall below **30 psi for five minutes.**

(13) If pressure falls below 30 psi, it must be determined if a fuel injector, the supply check valve within the fuel pump module, the fuel filter/pressure regulator, or a fuel tube/line is leaking.

(14) Again, start engine and bring to normal operating temperature.

(15) Shut engine off.

(16) **Testing for fuel injector or fuel rail leakage:** Clamp off the rubber hose portion of the 6539 Adaptor Tool between the fuel rail and the test port "T" on Adapter Tool (be sure clamping pressure is sufficient). If pressure now holds at or above 30 psi, a fuel injector or the fuel rail is leaking.

(17) Again, start engine and bring to normal operating temperature.

(18) Shut engine off.

(19) Raise vehicle.

(20) **Testing for fuel filter/pressure regulator leakage:** While continuing to securely clamp between the fuel rail and the test port "T" on Adaptor Tool 6539, securely clamp off **any** rubber hose portion of the Adaptor Tool 6539 that was installed between the fuel pressure line and the filter/regulator fitting (by restricting the pump module supply line's backflow, you isolate any leakdown originating from the filter/regulator via the tank return line.) If the pressure falls below 30 psi within 5 minutes, the filter/regulator is leaking. If it now holds at or above 30 psi, the electric fuel pump check valve is leaking or a fuel tube/line is leaking. A fuel odor presence would indicate the latter.

The electric fuel pump is not serviced separately. If replacement is necessary, replace the fuel pump module assembly. The filter/regulator may be replaced separately. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

- (1) Remove fuel fill cap.
- (2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
- (3) Start and run engine until it stalls.
- (4) Attempt restarting engine until it will no longer run.

FUEL DELIVERY (Continued)

- (5) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

- (6) Unplug connector from any fuel injector.
 (7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.
 (8) Connect other end of jumper wire to positive side of battery.
 (9) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

- (10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.

- (11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

- (12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.

- (13) Return fuel pump relay to PDC.

- (14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB® scan tool must be used to erase a DTC.

- 2 - EVAP LINE
- 3 - FUEL RETURN LINE (MALE)
- 4 - FUEL PRESSURE LINE (FEMALE)
- 5 - FUEL FILTER/PRESSURE REGULATOR
- 6 - FUEL TANK

OPERATION

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the Powertrain Control Module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi) at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump. The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump.

If fuel pressure at the pressure regulator exceeds approximately 49 psi, an internal diaphragm closes. Excess fuel is then routed into a separate fuel return line and returned to the fuel tank through the top of the fuel pump module.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for

extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

REMOVAL

The combination Fuel Filter/Fuel Pressure Regulator is remotely mounted to the vehicle body, above the rear axle and near the front of the fuel tank (Fig. 4) or (Fig. 5).

- (1) Perform Fuel System Pressure Release Procedure.
- (2) Disconnect negative battery cable at battery.
- (3) Raise vehicle.
- (4) Clean area around 3 filter/regulator fittings.
- (5) Disconnect fuel supply, fuel return and fuel pressure lines at filter/regulator (Fig. 4). Refer to Quick-Connect Fittings.
- (6) Remove 2 mounting bolts (Fig. 5) and remove filter/regulator.

80bfe151

Fig. 4 Fuel Filter/Fuel Pressure Regulator Location

INSTALLATION

The combination Fuel Filter/Fuel Pressure Regulator is remotely mounted to the vehicle body, above the rear axle and near the front of the fuel tank (Fig. 4) or (Fig. 5).

FUEL FILTER/PRESSURE REGULATOR (Continued)

Fig. 5 Fuel Filter/Fuel Pressure Regulator Removal/Installation

- 1 - FUEL FILTER/FUEL PRESSURE REGULATOR
2 - MOUNTING BOLTS (2)

- (1) Before installing filter/regulator, be sure all fittings are cleaned of all dirt and contaminants.
- (2) Be sure o-ring is positioned into fuel return fitting in filter/regulator.
- (3) Apply a small amount of clean engine oil to o-rings.
- (4) Position filter/regulator to body and install 2 bolts. Tighten bolts to 3 N·m (30 in. lbs.) torque.
- (5) Connect 3 fittings. Refer to Quick-Connect Fittings.
- (6) Connect negative battery cable to battery.
- (7) Start engine and check for leaks.

FUEL LEVEL SENDING UNIT / SENSOR

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

For Fuel Gauge Operation: A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel pump module electrical connector unplugged).** With the connectors plugged, output voltages will vary from about 0.6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models). The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

For OBD II Emission Monitor Requirements: The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

DIAGNOSIS AND TESTING - FUEL GAUGE SENDING UNIT

The fuel gauge sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to Instrument Panel and Gauges for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is part of the fuel pump module. Refer to Fuel Pump Module Removal/Installation for procedures. Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms (+/- 5%). With float in down position, resistance should be 270 ohms (+/- 5%).

FUEL LEVEL SENDING UNIT / SENSOR (Continued)

REMOVAL

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 6). The fuel pump module is located within the fuel tank.

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove electrical wire connector at sending unit terminals.

(4) Press upward on release tab (Fig. 7) to remove sending unit from pump module.

INSTALLATION

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 6). The fuel pump module is located within the fuel tank.

(1) Position sending unit to pump module and snap into place.

(2) Connect electrical connector to terminals.

(3) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(4) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL LINES

DESCRIPTION

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

FUEL PUMP

DESCRIPTION

The fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump.

OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** Refer to the Fuel Pressure Leak Down Test for more information.

DIAGNOSIS AND TESTING - FUEL PUMP CAPACITY TEST

Before performing this test, verify fuel pump pressure. Refer to Fuel Pump Pressure Test. Use this test in conjunction with the Fuel Pressure Leak Down Test.

(1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect fuel supply line at fuel rail. Refer to Quick-Connect Fittings. Some engines may require air cleaner housing removal before line disconnection.

(3) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(4) Connect correct Fuel Line Pressure Test Adapter Tool Hose into disconnected fuel supply line. Insert other end of Adaptor Tool Hose into a graduated container.

(5) Remove fuel fill cap.

(6) To activate fuel pump and pressurize system, obtain DRB® scan tool and actuate ASD Fuel System Test.

(7) A good fuel pump will deliver at least 1/4 liter of fuel in 7 seconds. Do not operate fuel pump for longer than 7 seconds with fuel line disconnected as fuel pump module reservoir may run empty.

(a) If capacity is lower than specification, but fuel pump can be heard operating through fuel fill

cap opening, check for a kinked/damaged fuel supply line somewhere between fuel rail and fuel pump module.

(b) If line is not kinked/damaged, and fuel pressure is OK, but capacity is low, replace fuel filter/fuel pressure regulator. The filter/regulator may be serviced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

(c) If both fuel pressure and capacity are low, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

DIAGNOSIS AND TESTING - FUEL PUMP AMPERAGE TEST

This amperage (current draw) test is to be done in conjunction with the Fuel Pump Pressure Test, Fuel Pump Capacity Test and Fuel Pressure Leak Down Test. Before performing the amperage test, be sure the temperature of the fuel tank is above 50° F (10° C).

The DRB® Scan Tool along with the DRB Low Current Shunt (LCS) adapter (Fig. 8) and its test leads will be used to check fuel pump amperage specifications.

80add391

Fig. 8 Low Current Shunt

- 1 - LOW CURRENT SHUNT ADAPTER
- 2 - PLUG TO DRB
- 3 - TEST LEAD RECEPTACLES

(1) Be sure fuel tank contains fuel before starting test. If tank is empty or near empty, amperage readings will be incorrect.

(2) Obtain LCS adapter.

(3) Plug cable from LCS adapter into DRB scan tool at SET 1 receptacle.

FUEL PUMP (Continued)

(4) Plug DRB into vehicle 16-way connector (data link connector).

(5) Connect (-) and (+) test cable leads into LCS adapter receptacles. Use **10 amp (10A +)** receptacle and common (-) receptacles.

(6) Gain access to MAIN MENU on DRB screen.

(7) Press DVOM button on DRB.

(8) Using left/right arrow keys, highlight CHANNEL 1 function on DRB screen.

(9) Press ENTER three times.

(10) Using up/down arrow keys, highlight RANGE on DRB screen (screen will default to 2 amp scale).

(11) Press ENTER to change 2 amp scale to 10 amp scale. **This step must be done to prevent damage to DRB scan tool or LCS adapter (blown fuse).**

(12) Remove cover from Power Distribution Center (PDC).

(13) Remove fuel pump relay from PDC. Refer to label on PDC cover for relay location.

WARNING: BEFORE PROCEEDING TO NEXT STEP, NOTE THE FUEL PUMP WILL BE ACTIVATED AND SYSTEM PRESSURE WILL BE PRESENT. THIS WILL OCCUR AFTER CONNECTING TEST LEADS FROM LCS ADAPTER INTO FUEL PUMP RELAY CAVITIES. THE FUEL PUMP WILL OPERATE EVEN WITH IGNITION KEY IN OFF POSITION. BEFORE ATTACHING TEST LEADS, BE SURE ALL FUEL LINES AND FUEL SYSTEM COMPONENTS ARE CONNECTED.

CAUTION: To prevent possible damage to the vehicle electrical system and LCS adapter, the test leads must be connected into relay cavities exactly as shown in following steps.

Depending upon vehicle model, year or engine configuration, three different types of relays may be used: Type-1, type-2 and type-3.

(14) If equipped with **type-1 relay** (Fig. 9), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 9).

(15) If equipped with **type-2 relay** (Fig. 10), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 10).

(16) If equipped with **type-3 relay** (Fig. 11), attach test leads from LCS adapter into PDC relay cavities number 3 and 5. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 11).

(17) When LCS adapter test leads are attached into relay cavities, fuel pump **will be activated**. Determine fuel pump amperage on DRB screen.

sure Leak Down tests were met, the fuel pump module is OK.

(18) If amperage is more than 10.0 amps, replace fuel pump module assembly. The electric fuel pump is not serviced separately.

(19) Disconnect test leads from relay cavities immediately after testing.

DIAGNOSIS AND TESTING - FUEL PUMP PRESSURE TEST

Use this test in conjunction with other fuel system tests. Refer to the Fuel Pump Capacity Test, Fuel Pressure Leak Down Test and Fuel Pump Amperage Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

The fuel system is equipped with a combination fuel filter/fuel pressure regulator. The fuel pressure regulator is not controlled by engine vacuum.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. BEFORE DISCONNECTING FUEL LINE AT FUEL RAIL, THIS PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

(1) Remove pressure test port cap at fuel rail test port (Fig. 12) or (Fig. 13). Connect 0–414 kPa (0–60 psi) fuel pressure gauge (from gauge set 5069) to test port pressure fitting on fuel rail (Fig. 14). **The DRB III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

80bfe150

- 12 - INJ.#8
- 13 - PRESSURE TEST PORT CAP

(3) If engine runs, but pressure is below 44.2 psi, determine if fuel pump or filter/regulator is defective. Proceed to next step:

(a) Check for a kinked fuel supply line somewhere between fuel rail and fuel pump module.

(b) If line is not kinked and pressure is low, raise vehicle and disconnect fuel pressure line at fuel filter/fuel pressure regulator (Fig. 15). Three fuel lines are attached to filter/regulator. The **fuel pressure line** is attached to the right side of filter/regulator. It is also the most rearward of the two (Fig. 15).

FUEL PUMP (Continued)

(c) Install Special 5/16" Fuel Line Adapter Tool # 6539 between disconnected fuel line and filter/regulator fitting

(d) Attach 0–60 psi fuel pressure test gauge to "T" fitting on tool 6539.

(e) Use DRB scan tool to power fuel pump. If pressure is now within specifications, replace fuel filter/fuel pressure regulator.

(f) If pressure is still low, replace fuel pump module.

(4) If operating pressure is above 54.2 psi, electric fuel pump is OK, but fuel pressure regulator is defective. Replace fuel filter/fuel pressure regulator.

(5) Install test port cap to fuel rail test port.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module is installed in the top of the fuel tank (Fig. 16). The fuel pump module (Fig. 17) contains the following components:

- A separate fuel pick-up filter (strainer)
- An electric fuel pump
- A threaded locknut to retain module to tank
- A gasket between tank flange and module
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply tube (line) connection
- Fuel return tube (line) connection

The fuel gauge sending unit and pick-up filter may be serviced separately. If the electrical fuel pump requires service, the entire fuel pump module must be replaced.

OPERATION

Refer to Fuel Pump, Fuel Filter/Fuel Pressure Regulator and Fuel Gauge Sending Unit.

REMOVAL

Fuel tank removal will be necessary for fuel pump module removal.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING FUEL PUMP MODULE, FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Perform Fuel System Pressure Release Procedure.

(2) Drain fuel tank and remove tank. Refer to Fuel Tank Removal/Installation.

(3) Thoroughly wash and clean area around pump module to prevent contaminants from entering tank.

(4) Disconnect fuel return and pressure lines from fuel pump module fittings (Fig. 18). Refer to Quick-Connect Fittings for procedures.

80b77009

(5) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 18). Install Special Tool 6856 to fuel pump module locknut and remove locknut (Fig. 19). The fuel pump module will spring up slightly after locknut is removed.

(6) Remove module from fuel tank.

INSTALLATION

Fuel tank removal will be necessary for fuel pump module removal.

CAUTION: Whenever fuel pump module is serviced, module gasket must be replaced.

(1) Thoroughly clean locknut threads and mating fuel tank threads. Use a soap/water solution. Do not use carburetor cleaner to clean threads.

(2) Using new gasket, position fuel pump module into opening in fuel tank.

(3) Apply clean water to locknut threads.

(4) Position locknut over top of fuel pump module.

(5) Rotate module until indexing arrow at top of module (Fig. 20) is pointed toward rear of vehicle. Align arrow to tick mark on top of fuel tank. **This**

step must be done to prevent float/float rod assembly from contacting sides of fuel tank.

- (6) Install Special Tool 6856 to locknut.
- (7) Tighten locknut to 74 N·m (55 ft. lbs.) torque.
- (8) Connect fuel return and pressure lines to fuel pump module fittings (Fig. 18). Refer to Quick-Connect Fittings.
- (9) Install fuel tank. Refer to Fuel Tank Installation.

FUEL RAIL

DESCRIPTION - 4.7L

The fuel injector rail is used to mount the fuel injectors to the engine. It is mounted to the intake manifold (Fig. 21).

DESCRIPTION - 4.0L

The fuel injector rail is used to mount the fuel injectors to the engine (Fig. 22). On the 4.0L 6-cylinder engine, a **fuel damper** is located near the center of the fuel rail (Fig. 22).

OPERATION - 4.7L

High pressure fuel from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

A fuel pressure test port is located on the fuel rail (Fig. 21). A quick-connect fitting with a safety latch is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

OPERATION - 4.0L

The fuel injector rail supplies the necessary fuel to each individual fuel injector.

High pressure fuel from the fuel pump is routed to the fuel rail. The fuel rail then supplies the necessary fuel to each individual fuel injector.

The fuel damper is used only to help control fuel pressure pulsations. These pulsations are the result of the firing of the fuel injectors. It is **not used** as a fuel pressure regulator. The fuel pressure regulator is **not mounted** to the fuel rail on any engine. It is located near the front of the fuel tank above the rear axle. Refer to Fuel Filter/Fuel Pressure Regulator in this group for information.

A fuel pressure test port is located on the fuel rail (Fig. 22). A quick-connect fitting with a safety latch is used to attach the fuel line to the fuel rail.

The fuel rail is not repairable.

REMOVAL - 4.7L

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube (Fig. 23). Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.

Fig. 24 Remove/Install Injector Connector—4.7L V-8 Engine

(15) Remove fuel rail (with injectors attached) from engine.

(16) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

REMOVAL - 4.0L

The fuel damper is not serviced separately.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF. THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL RAIL.

- (1) Remove fuel tank filler tube cap.
- (2) Perform Fuel System Pressure Release Procedure.
- (3) Disconnect negative battery cable from battery.
- (4) Remove air tube at top of throttle body. Note: Some engine/vehicles may require removal of air cleaner ducts at throttle body.
- (5) Disconnect electrical connectors at all 6 fuel injectors. To remove connector refer to (Fig. 26). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

- 11 - QUICK-CONNECT FITTING

(6) Remove oxygen sensor wiring clip nuts at fuel rail mounting studs (certain emissions packages only).

(7) Disconnect fuel supply line latch clip and fuel line at fuel rail. Refer to Quick-Connect Fittings.

(8) Disconnect throttle cable at throttle body. Refer to Throttle Cable Removal/Installation.

(9) Disconnect speed control cable at throttle body (if equipped). Refer to Speed Control Cable.

(10) Disconnect automatic transmission cable at throttle body (if equipped).

(11) Remove cable routing bracket at intake manifold.

(12) Clean dirt/debris from each fuel injector at intake manifold.

(13) Remove fuel rail mounting nuts/bolts (Fig. 25).

FUEL RAIL (Continued)

Fig. 26 Remove/Install Injector Connector—4.0L Engine

(14) Remove fuel rail by gently rocking until all fuel injectors have cleared machined holes at intake manifold.

(15) If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

INSTALLATION - 4.7L

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.

(2) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(3) Position fuel rail/fuel injector assembly to machined injector openings in cylinder head.

(4) Guide each injector into cylinder head. Be careful not to tear injector o-rings.

(5) Push **right** side of fuel rail down until fuel injectors have bottomed on cylinder head shoulder. Push **left** fuel rail down until injectors have bottomed on cylinder head shoulder.

(6) Install 4 fuel rail mounting bolts and tighten to 27 N·m (20 ft. lbs.).

(7) Install ignition coils. Refer to Ignition Coil Removal/Installation.

(8) Connect electrical connectors to throttle body.

(9) Connect electrical connectors to MAP and IAT sensors.

(10) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 24). Push connector onto injector (1) and then push and lock red

colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(11) Connect vacuum lines to throttle body.

(12) Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.

(13) Connect wiring to rear of generator.

(14) Install air box to throttle body.

(15) Install air duct to air box.

(16) Connect battery cable to battery.

(17) Start engine and check for leaks.

INSTALLATION - 4.0L

(1) If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.

(2) Clean each injector bore at intake manifold.

(3) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.

(4) Position tips of all fuel injectors into the corresponding injector bore in intake manifold. Seat injectors into manifold.

(5) Install and tighten fuel rail mounting bolts to 11 ± 3 N·m (100 ± 25 in. lbs.) torque.

(6) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 26). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(7) Connect fuel line and fuel line latch clip to fuel rail. Refer Quick-Connect Fittings.

(8) Install protective cap to pressure test port fitting (if equipped).

(9) Install cable routing bracket to intake manifold.

(10) Connect throttle cable at throttle body.

(11) Connect speed control cable at throttle body (if equipped).

(12) Connect automatic transmission cable at throttle body (if equipped).

(13) Install oxygen sensor wiring clip nuts to fuel rail mounting studs (certain emissions packages only).

(14) Install air tube (or duct) at top of throttle body.

(15) Install fuel tank cap.

(16) Connect negative battery cable to battery.

(17) Start engine and check for fuel leaks.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module.

FUEL TANK (Continued)

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

A rollover valve(s) is mounted into the top of the fuel tank (or pump module). Refer to Rollover Valve for additional information.

An evaporation control system is connected to the rollover valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to Emission Control System for additional information.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF. PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL TANK.

Two different procedures may be used to drain fuel tank (through tank vent fitting or using DRB scan tool). The quickest is draining through tank vent fitting.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure for procedures. Attach end of Special Adapter Hose Tool number 6539 at fuel rail disconnection. Position opposite end of 6539 to an approved gasoline draining station. Activate fuel pump with DRB and drain tank until empty.

If electric fuel pump is not operating, tank **MUST** be drained through vent fitting.

(1) Release fuel system pressure. Refer to Fuel System Pressure Release Procedure.

(2) Disconnect negative battery cable at battery.

(3) Raise and support vehicle.

(4) Working from front of fuel tank, loosen clamp at fuel **vent** hose at fuel tank end of hose (Fig. 27). Remove hose at tank fitting.

(5) Obtain a length of 3/8" O.D. thinwall, clear tubing.

(6) Position 3/8" O.D. tubing into tank vent fitting. Attach 3/8" tubing to an approved gasoline draining station. Drain tank until empty.

(7) Remove rear tow hooks (if equipped).

(8) Remove optional trailer hitch (if equipped).

(9) Remove fuel tank-to-rear bumper fascia clips (Fig. 28).

(10) Remove fuel tank heat shield mounting bolts (Fig. 29).

CAUTION: To protect fuel tank from exhaust heat, shield must re-installed after tank installation.

WARNING: PLACE SHOP TOWEL AROUND FUEL LINES TO CATCH ANY EXCESS FUEL.

(11) Disconnect fuel return line at fuel filter/fuel pressure regulator (Fig. 30). Refer to Quick-Connect Fittings for procedures.

(12) Disconnect fuel pressure line at fuel filter/fuel pressure regulator (Fig. 30). Refer to Quick-Connect Fittings for procedures.

(13) Disconnect EVAP canister vent line near front of tank (Fig. 30).

(14) Disconnect fuel pump module electrical connector (pigtail harness) near front of tank (Fig. 30). Harness connector is clipped to body.

(15) Cut and discard tie strap supporting rear axle vent hose to tank vent hose (Fig. 31).

(16) Remove clamp on axle vent hose at rear axle.

(17) Remove vent hose from fitting at rear axle.

(18) Loosen fill and vent hose clamps at body (Fig. 31). Disconnect fill and vent hoses at filler tube assembly.

(19) Place hydraulic jack to bottom of fuel tank.

(20) Remove tank-to-frame mounting bolts (Fig. 32).

(21) Carefully lower tank until clear of vehicle. Place tank on floor.

(22) If necessary, remove two fuel tank strap nuts (Fig. 32).

(23) If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation.

(24) If hoses are to be removed at fuel tank end, note painted alignment (indexing) markings on hoses, and molded indexing tangs on tank before removal. Remove hoses.

(25) If necessary, remove 3 fuel filler tube assembly mounting bolts (Fig. 33) and remove fuel filler tube.

INSTALLATION

(1) If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation.

(2) If necessary, position fuel filler tube assembly to body. Install 3 bolts and tighten to 2 N·m (15 in. lbs.) torque.

(3) Install fuel fill/vent hoses to tank fittings. To prevent hoses from kinking, rotate each hose until painted indexing mark on hose is aligned to molded indexing tang on tank.

(4) Install hose clamps to hoses. Tighten clamp screws to 3 N·m (25 in. lbs.) torque.

(5) Position fuel tank to hydraulic jack.

(6) Raise tank into position.

(7) Install fuel tank mounting bolts. Tighten bolts to 81 N·m (60 ft. lbs.) torque.

(8) Install fuel fill and vent hoses to fuel fill tube at body. Install clamps and tighten clamp screws to 3 N·m (25 in. lbs.) torque.

(9) Connect fuel pump module pigtail harness electrical connector near front of tank.

(10) Connect both fuel lines to fuel filter/fuel pressure regulator. Refer to Quick-Connect Fittings for procedures.

(11) Connect EVAP hose near front of tank.

- 1 - FUEL FILLER TUBE
2 - MOUNTING BOLTS (3)

INLET FILTER

REMOVAL

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 34). The fuel pump module is located on top of fuel tank.

**Fig. 34 Fuel Pump Inlet Filter**

- 1 - FUEL PUMP MODULE
2 - FUEL PUMP INLET FILTER

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 34). The fuel pump module is located on top of fuel tank.

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove filter by prying from bottom of module with 2 screwdrivers. Filter is snapped to module.

(4) Clean bottom of pump module.

INSTALLATION

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 34). The fuel pump module is located on top of fuel tank.

(1) Snap new filter to bottom of module.

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/Installation.

QUICK CONNECT FITTING

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

STANDARD PROCEDURES - QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

QUICK CONNECT FITTING (Continued)

DISCONNECTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

CAUTION: The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 35). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component.

(a) Press release tab on side of fitting to release pull tab (Fig. 36). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 36).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 37).

(5) **Two-Tab Type Fitting:** This type of fitting is equipped with tabs located on both sides of fitting (Fig. 38). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 38) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

(6) **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 39) usually black in color.

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 39). With plastic ring

depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 40) or (Fig. 41). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 40).

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 41) and swing away from fuel line.

(c) Slide latch clip toward fuel rail while lifting with screwdriver.

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 42). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(8) Disconnect quick-connect fitting from fuel system component being serviced.

CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

ROLLOVER VALVE**DESCRIPTION**

The fuel tank is equipped with a rollover valve. The valve is located on the top of the fuel tank (Fig. 43).

OPERATION

The rollover valve will prevent fuel flow through the fuel tank vent (EVAP) hoses in the event of an accidental vehicle rollover. The EVAP canister draws fuel vapors from the fuel tank through this valve.

ROLLOVER VALVE (Continued)

**Fig. 43 Rollover Valve Location**

The valve cannot be serviced separately. If replacement is necessary, the fuel tank must be replaced. Refer to Fuel Tank Removal/Installation.

REMOVAL

The rollover valves(s) are/is molded into the fuel tank and are not serviced separately. If replacement is necessary, the fuel tank must be replaced. Refer to Fuel Tank Removal/Installation.

FUEL INJECTION

DIAGNOSIS AND TESTING - VISUAL INSPECTION

A visual inspection for loose, disconnected or incorrectly routed wires, vacuum lines and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify three 32-way electrical connectors are fully inserted into connector of Powertrain Control Module (PCM) (Fig. 1).

(2) Inspect battery cable connections. Be sure they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect ASD and oxygen sensor heater relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 2). Refer to label on PDC cover for relay location.

(4) Inspect ignition coil connections (Fig. 3) or (Fig. 4).

FUEL INJECTION (Continued)

(7) Verify generator output wire (B+ wire) and generator field connector are firmly connected to generator.

(8) Inspect system body grounds for loose or dirty connections. Refer to Group 8, Wiring for ground locations.

(9) Verify crankcase ventilation (CCV) operation. Refer to Emission Control System for additional information.

(10) Inspect all fuel line quick-connect fittings for damage or leaks.

(11) Verify hose connections to all ports of vacuum fittings on intake manifold, and for emission system are tight and not leaking.

(12) Inspect accelerator cable, transmission throttle cable (if equipped) and speed control cable connections (if equipped). Check their connections to throttle body linkage for any binding or restrictions.

(13) Verify vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(14) Inspect air cleaner inlet and air cleaner element for dirt or restrictions.

- 2 - ENGINE COOLANT TEMPERATURE SENSOR
- 3 - ELECTRICAL CONNECTOR

(19) 4.7L Engine: Verify MAP and Engine Coolant Temperature (ECT) sensor electrical connectors are firmly connected to sensors (Fig. 12).

(20) Verify fuel injector wire harness connectors are firmly connected to injectors in correct order. Each harness connector is numerically tagged with injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(21) Raise and support vehicle.

(22) Verify all oxygen sensor wire connectors are firmly connected to sensors. Inspect sensors and connectors for damage (Fig. 13) or (Fig. 14).

(23) Inspect for pinched or leaking fuel tubes/lines. Inspect for pinched, cracked or leaking fuel hoses.

Fig. 12 MAP and ECT Sensor Locations—4.7L V-8 Engine

- 1 - ECT SENSOR
- 2 - MOUNTING BOLTS (2)
- 3 - MAP SENSOR
- 4 - INTAKE MANIFOLD

(24) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic converter.

(25) If equipped with automatic transmission, verify electrical harness is firmly connected to park/neutral switch and to transmission components.

(26) Verify fuel pump module pigtail harness electrical connector (Fig. 15) is firmly connected to body harness connector.

(27) Inspect fuel line harness (from fuel pump module) at fuel filter/fuel pressure regulator (Fig. 15) for chaffing, cracks or leaks.

(28) Verify battery cable and solenoid feed wire connections to starter solenoid are tight and clean.

(29) Inspect for chaffed wires or wires rubbing up against other components.

ACCELERATOR PEDAL

REMOVAL

The accelerator pedal is connected to the throttle body linkage by the throttle cable. The cable is protected by a plastic sheathing and is connected to the throttle body linkage by a ball socket. It is connected to the accelerator pedal arm by a plastic retainer (clip) (Fig. 16). This retainer (clip) snaps into the top of the accelerator pedal arm. A retainer clip (Fig. 16) is also used to fasten cable to dash panel.

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm. Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove accelerator pedal bracket nuts. Remove accelerator pedal assembly.

INSTALLATION

The accelerator pedal is connected to the throttle body linkage by the throttle cable. The cable is protected by a plastic sheathing and is connected to the throttle body linkage by a ball socket. It is connected to the accelerator pedal arm by a plastic retainer (clip) (Fig. 16). This retainer (clip) snaps into the top of the accelerator pedal arm. A retainer clip (Fig. 16) is also used to fasten cable to dash panel.

(1) Place accelerator pedal assembly over studs protruding from floor pan. Tighten mounting nuts to 12 N·m \pm 2 N·m (105 in. lbs. \pm 20 in. lbs.) torque.

80b77008

- 5 - PEDAL/BRAKET ASSEMBLY
- 6 - MOUNTING STUDS (2)

(2) Slide throttle cable into opening in top of pedal arm. Push plastic cable retainer (clip) into pedal arm opening until it snaps into place.

(3) Before starting engine, operate accelerator pedal to check for any binding.

CRANKSHAFT POSITION SENSOR

DESCRIPTION - 4.0L

The Crankshaft Position Sensor (CKP) is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 17).

80b89904

Fig. 17 CKP Sensor Location—4.0L 6-Cyl. Engine

- 1 - SLOTTED HOLE
- 2 - CRANKSHAFT POSITION SENSOR
- 3 - WIRE SHIELD
- 4 - MOUNTING BOLT
- 5 - TRANSMISSION HOUSING
- 6 - PAPER SPACER

DESCRIPTION - 4.7L

The Crankshaft Position Sensor (CKP) is mounted into the engine block above the starter motor (Fig. 18).

OPERATION - 4.0L

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On 4.0L 6-cylinder engines, the flywheel/drive plate has 3 sets of four notches at its outer edge (Fig. 19).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input

80b76ff0

Fig. 18 CKP Sensor Location—4.7L V-8 Engine

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - STARTER
- 3 - ELEC. CONNECTOR

to the PCM. For each engine revolution there are 3 sets of four pulses generated.

The trailing edge of the fourth notch, which causes the pulse, is four degrees before top dead center (TDC) of the corresponding piston.

The engine will not operate if the PCM does not receive a crankshaft position sensor input.

OPERATION - 4.7L

Engine speed and crankshaft position are provided through the crankshaft position sensor. The sensor generates pulses that are the input sent to the powertrain control module (PCM). The PCM interprets the sensor input to determine the crankshaft position. The PCM then uses this position, along with other inputs, to determine injector sequence and ignition timing.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

On the 4.7L V-8 engine, a tonewheel is bolted to the engine crankshaft (Fig. 20). This tonewheel has sets of notches at its outer edge (Fig. 20).

The notches cause a pulse to be generated when they pass under the sensor. The pulses are the input to the PCM.

REMOVAL - 4.0L

The Crankshaft Position (CKP) sensor is mounted to the transmission bellhousing at the left/rear side

CRANKSHAFT POSITION SENSOR (Continued)

- 1 - SLOTTED HOLE
- 2 - CRANKSHAFT POSITION SENSOR
- 3 - WIRE SHIELD
- 4 - MOUNTING BOLT
- 5 - TRANSMISSION HOUSING
- 6 - PAPER SPACER

- (1) Disconnect sensor pigtail harness (3-way connector) from main engine wiring harness.
- (2) Remove sensor mounting bolt.
- (3) Remove wire shield and sensor.

REMOVAL - 4.7L

The Crankshaft Position (CKP) sensor is bolted to the side of the engine cylinder block above the starter motor (Fig. 22). It is positioned into a machined hole at the side of the engine block.

- (1) Remove starter motor. Refer to Starter Removal/Installation.
- (2) Disconnect CKP electrical connector at sensor (Fig. 22).
- (3) Remove CKP mounting bolt (Fig. 23).
- (4) Carefully pry sensor from cylinder block in a rocking action with two small screwdrivers.
- (5) Remove sensor from vehicle.
- (6) Check condition of sensor o-ring.

INSTALLATION - 4.0L

The Crankshaft Position (CKP) sensor is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 21). The sensor is **adjustable** and is attached with one bolt. A wire shield/router is attached to the sensor (Fig. 21).

80b76ff1

Fig. 23 CKP Sensor Removal/Installation—4.7L V-8 Engine

- 1 - CRANKSHAFT POSITION SENSOR
2 - MOUNTING BOLT

New replacement sensors will be equipped with a paper spacer glued to bottom of sensor. If installing

(returning) a **used** sensor to vehicle, a new paper spacer must be installed to bottom of sensor. This spacer will be ground off the first time engine is started. If spacer is not used, sensor will be broken the first time engine is started.

(1) New Sensors: Be sure paper spacer is installed to bottom of sensor. If not, obtain spacer PN05252229.

(2) Used Sensors: Clean bottom of sensor and install spacer PN05252229.

(3) Install sensor into transmission bellhousing hole.

(4) Position sensor wire shield to sensor (Fig. 21).

(5) Push sensor against flywheel/drive plate. With sensor pushed against flywheel/drive plate, tighten mounting bolt to 7 N·m (60 in. lbs.) torque.

(6) Route sensor wiring harness into wire shield.

(7) Connect sensor pigtail harness electrical connector to main wiring harness.

INSTALLATION - 4.7L

(1) Clean out machined hole in engine block.

(2) Apply a small amount of engine oil to sensor o-ring.

(3) Install sensor into engine block with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

CAUTION: Before tightening sensor mounting bolt, be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

(4) Install mounting bolt and tighten to 28 N·m (21 ft. lbs.) torque.

(5) Connect electrical connector to sensor.

(6) Install starter motor. Refer to Starter Removal/Installation.

FUEL INJECTOR**DESCRIPTION**

A separate fuel injector (Fig. 24) is used for each individual cylinder.

OPERATION

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

FUEL INJECTOR (Continued)

Fig. 24 Fuel Injector—4.0L/4.7L Engines

- 1 - FUEL INJECTOR
- 2 - NOZZLE
- 3 - TOP (FUEL ENTRY)

The top (fuel entry) end of the injector (Fig. 24) is attached into an opening on the fuel rail.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are electrically energized, individually and in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

OPERATION - PCM OUTPUT

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust

injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

DIAGNOSIS AND TESTING - FUEL INJECTOR TEST

To perform a complete test of the fuel injectors and their circuitry, use the DRB scan tool and refer to the appropriate Powertrain Diagnostics Procedures manual. To test the injector only, refer to the following:

Disconnect the fuel injector wire harness connector from the injector. The injector is equipped with 2 electrical terminals (pins). Place an ohmmeter across the terminals. Resistance reading should be approximately 12 ohms \pm 1.2 ohms at 20°C (68°F).

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL INJECTOR(S), FUEL SYSTEM PRESSURE MUST BE RELEASED.

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

- (1) Perform Fuel System Pressure Release Procedure.
- (2) Remove fuel injector rail. Refer to Fuel Injector Rail Removal/Installation.
- (3) Remove clip(s) retaining injector(s) to fuel rail (Fig. 25).
- (4) Remove injector(s) from fuel rail.

INSTALLATION

- (1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
- (2) Install injector(s) and injector clip(s) to fuel rail.
- (3) Install fuel rail assembly. Refer to Fuel Injector Rail Removal/Installation.
- (4) Start engine and check for leaks.

FUEL PUMP RELAY

DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

FUEL PUMP RELAY (Continued)

80b898e8

Fig. 25 Fuel Injector Mounting—Typical (4.7L V-8 Engine Shown)

- 1 - INLET FITTING
- 2 - FUEL INJECTOR RAIL
- 3 - CLIP
- 4 - FUEL INJECTOR

OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

IDLE AIR CONTROL MOTOR

DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

IAC Stepper Motor Program: The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

IDLE AIR CONTROL MOTOR (Continued)

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a "No-Load" engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

REMOVAL - 4.0L

The IAC motor is located on the throttle body.

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect electrical connector from IAC motor (Fig. 38).
- (3) Remove two mounting bolts (screws) (Fig. 26).
- (4) Remove IAC motor from throttle body.

Fig. 26 Mounting Bolts (Screws)—IAC

- 1 - IDLE AIR CONTROL MOTOR
2 - MOUNTING SCREWS

REMOVAL - 4.7L

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect electrical connector from IAC motor (Fig. 34).
- (3) Remove two mounting bolts (screws) (Fig. 40).

- (4) Remove IAC motor from throttle body.

INSTALLATION - 4.0L

The IAC motor is located on the throttle body.

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner duct/air box to throttle body.

INSTALLATION - 4.7L

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air duct/air box to throttle body.

INTAKE AIR TEMPERATURE SENSOR

DESCRIPTION

The 2-wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5-volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

REMOVAL - 4.0L

The Intake Manifold Air Temperature (IAT) sensor is installed into the intake manifold plenum near the front of the throttle body (Fig. 27).

- (1) Disconnect electrical connector from sensor.
- (2) Remove sensor from intake manifold.

MAP SENSOR**DESCRIPTION**

On the 4.0L six-cylinder engine the MAP sensor is mounted to the engine throttle body. On the 4.7L V-8 engine the MAP sensor is mounted to front of the intake manifold.

OPERATION

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance.

MAP SENSOR (Continued)

When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
 - Idle speed
 - Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which

stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately. The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops .10 in. Hg. If a storm goes through it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

REMOVAL - 4.0L

The MAP sensor is mounted to the side of the throttle body (Fig. 38). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 29).

- (1) Disconnect electrical connector at sensor.
- (2) Clean area around MAP sensor.
- (3) Remove 2 sensor mounting bolts (Fig. 30).
- (4) Remove MAP sensor from intake manifold.

INSTALLATION - 4.0L

The MAP sensor is mounted to the side of the throttle body (Fig. 38). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 29).

- (1) Install rubber L-shaped fitting to MAP sensor.
- (2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.
- (3) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (4) Install air cleaner duct/air box.

INSTALLATION - 4.7L

The MAP sensor is located on the front of the intake manifold (Fig. 30). An o-ring seals the sensor to the intake manifold.

- (1) Clean MAP sensor mounting hole at intake manifold.
- (2) Check MAP sensor o-ring seal for cuts or tears.
- (3) Position sensor into manifold.
- (4) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (5) Connect electrical connector.

O2S HEATER RELAY

DESCRIPTION

The 2 oxygen (O₂) sensor heater relays (upstream and downstream) are located in the Powertrain Distribution Center (PDC).

OPERATION

Engines equipped with the California (NAE) Emissions Package use **four O₂ sensors**.

Two of the four sensor heater elements (upstream sensors 1/1 and 2/1) are controlled by the upstream heater relay through output signals from the Powertrain Control Module (PCM).

The other two heater elements (downstream sensors 1/2 and 2/2) are controlled by the downstream heater relay through output signals from the PCM.

To avoid a large simultaneous current surge, power is delayed to the 2 downstream heater elements by the PCM for approximately 2 seconds.

REMOVAL

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

- (1) Install relay to PDC.
- (2) Install cover to PDC.

O2S SENSOR

DESCRIPTION

The Oxygen Sensors (O₂S) are attached to, and protrude into the vehicle exhaust system. Depending on the emission package, the vehicle may use a total of either 2 or 4 sensors.

O2S SENSOR (Continued)

Federal Emissions Package: Two sensors are used: upstream (referred to as 1/1) and downstream (referred to as 1/2). With this emission package, the upstream sensor (1/1) is located just before the main catalytic convertor. The downstream sensor (1/2) is located just after the main catalytic convertor.

4.7L V-8 With California Emissions Package: On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the right upstream sensor (2/1) is located in the right exhaust downpipe just before the mini-catalytic convertor. The left upstream sensor (1/1) is located in the left exhaust downpipe just before the mini-catalytic convertor. The right downstream sensor (2/2) is located in the right exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor. The left downstream sensor (1/2) is located in the left exhaust downpipe just after the mini-catalytic convertor, and before the main catalytic convertor.

4.0L 6-Cylinder With California Emissions Package: On this emissions package, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2). With this emission package, the rear/upper upstream sensor (2/1) is located in the exhaust downpipe just before the rear mini-catalytic convertor. The front/upper upstream sensor (1/1) is located in the exhaust downpipe just before the front mini-catalytic convertor. The rear/lower downstream sensor (2/2) is located in the exhaust downpipe just after the rear mini-catalytic convertor, and before the main catalytic convertor. The front/lower downstream sensor (1/2) is located in the exhaust downpipe just after the front mini-catalytic convertor, and before the main catalytic convertor.

OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

The O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the wire harness. This is why it is important to never solder an O2 sensor connector, or pack the connector with grease.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

Oxygen Sensor Heaters/Heater Relays: Depending on the emissions package, the heating elements within the sensors will be supplied voltage from either the ASD relay, or 2 separate oxygen sensor relays. Refer to Wiring Diagrams to determine which relays are used.

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 4.5 ohms on 4.0L engines. It is approximately 13.5 ohms on the 4.7L engine. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

Upstream Sensor (Non-California Emissions): The upstream sensor (1/1) provides an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensor. The PCM will change the air/fuel ratio until the upstream sensor inputs a voltage that the PCM has determined will make the downstream sensor output (oxygen content) correct.

The upstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

Downstream Sensor (Non-California Emissions): The downstream oxygen sensor (1/2) is also used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is

O2S SENSOR (Continued)

required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensor also provides an input to determine catalytic convertor efficiency.

Upstream Sensors (California Engines): Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Downstream Sensors (California Engines): Two downstream sensors are used (1/2 and 2/2). The downstream sensors are used to determine the correct air-fuel ratio. As the oxygen content changes at the downstream sensor, the PCM calculates how much air-fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage, and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency. Main catalytic convertor efficiency is not calculated with this package.

Engines equipped with either a downstream sensor(s), or a post-catalytic sensor, will monitor catalytic convertor efficiency. If efficiency is below emission standards, the Malfunction Indicator Lamp (MIL) will be illuminated and a Diagnostic Trouble Code (DTC) will be set. Refer to Monitored Systems in Emission Control Systems for additional information.

REMOVAL

Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness. For sensor operation, it must have a comparison source of oxygen from outside the exhaust system. This fresh air is supplied to the sensor through its pigtail wiring harness.

Oxygen sensor (O2S) locations are shown in (Fig. 31) and (Fig. 32).

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER(S) BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

- (1) Raise and support vehicle.
- (2) Disconnect O2S pigtail harness from main wiring harness.
- (3) If equipped, disconnect sensor wire harness mounting clips from engine or body.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

- (4) Remove O2S sensor with an oxygen sensor removal and installation tool.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

- (1) Install O2S sensor. Tighten to 30 N-m (22 ft. lbs.) torque.
- (2) Connect O2S sensor wire connector to main wiring harness.
- (3) If equipped, connect sensor wire harness mounting clips to engine or body. **When Equipped: The O2S pigtail harness must be clipped and/or bolted back to their original positions on engine or body to prevent mechanical damage to wiring.**
- (4) Lower vehicle.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

REMOVAL - 4.0L

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

- (1) Remove air cleaner duct and air resonator box at throttle body.
- (2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 33).
- (3) Remove all control cables from throttle body (lever) arm. Refer to Accelerator Pedal and Throttle Cable.
- (4) Remove four throttle body mounting bolts.

speed using this screw. All idle speed functions are controlled by the Powertrain Control Module (PCM).

- (1) Clean the mating surfaces of the throttle body and the intake manifold.
- (2) Install new throttle body-to-intake manifold gasket.
- (3) Install throttle body to intake manifold.
- (4) Install four mounting bolts. Tighten bolts to 11 N·m (100 in. lbs.) torque.
- (5) Install control cables.
- (6) Install electrical connectors.
- (7) Install air duct and air box at throttle body.

INSTALLATION - 4.7L

- (1) Clean throttle body-to-intake manifold o-ring.
- (2) Clean mating surfaces of throttle body and intake manifold.
- (3) Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
- (4) Install three mounting bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.
- (5) Install control cables.
- (6) Install vacuum line to throttle body.
- (7) Install electrical connectors.
- (8) Install air duct/air box at throttle body.

THROTTLE CONTROL CABLE

REMOVAL - 4.0L

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 16). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove cable core wire at pedal arm.

(3) From inside vehicle, remove clip holding cable to dashpanel (Fig. 16).

(4) Remove cable housing from dash panel and pull into engine compartment.

(5) Remove (unsnap) cable from routing clips on engine valve cover.

(6) Remove cable connector at throttle body bellcrank ball by unsnapping rearward (Fig. 35).

(7) Remove throttle cable from bracket by compressing release tabs (Fig. 35) and pushing cable through hole in bracket.

(8) Remove throttle cable from vehicle.

REMOVAL - 4.7L

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or throttle cable.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of pedal arm (Fig. 16). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove cable core wire at pedal arm.

(3) From inside vehicle, remove clip holding cable to dashpanel (Fig. 16).

(4) Remove air box at throttle body.

(5) Unsnap cable from plenum routing clip.

(6) Remove cable housing from dash panel and pull into engine compartment.

(7) Using finger pressure only, disconnect accelerator cable connector at throttle body bellcrank pin by pushing connector off bellcrank pin towards front of vehicle (Fig. 36). **DO NOT try to pull connector off perpendicular to the bellcrank pin. Connector will be broken.**

(8) Lift accelerator cable from top of cable cam (Fig. 36).

(9) Press tab (Fig. 37) to release plastic cable mount from bracket. **Press on tab only enough to release cable from bracket. If tab is pressed too much, it will be broken.** Slide plastic mount (Fig. 37) towards passenger side of vehicle to remove cable from bracket.

(10) Remove throttle cable from vehicle.

INSTALLATION - 4.0L

(1) Slide throttle cable through hole in bracket until release tabs lock into bracket.

(2) Connect cable ball end to throttle body bellcrank ball (snaps on).

(3) Snap cable into routing clips on engine valve cover.

(4) Slide rubber grommet away from plastic cable housing.

(5) Install rubber grommet into dash panel until seated.

(6) Push cable housing into rubber grommet and through opening in dash panel.

(7) From inside vehicle, install clip holding cable to dashpanel (Fig. 16).

(8) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.

(9) Push cable retainer (clip) into pedal arm opening until it snaps in place.

(10) Before starting engine, operate accelerator pedal to check for any binding.

INSTALLATION - 4.7L

(1) Slide accelerator cable plastic mount into bracket. Continue sliding until tab (Fig. 37) is aligned to hole in mounting bracket.

(2) Route accelerator cable over top of cable cam.

(3) Connect cable end to throttle body bellcrank pin (snaps on rearward).

(4) Slide rubber grommet away from plastic cable housing.

(5) Install rubber grommet into dash panel until seated.

(6) Push cable housing into rubber grommet and through opening in dash panel.

(7) From inside vehicle, install clip holding cable to dashpanel (Fig. 16).

(8) From inside vehicle, slide throttle cable core wire into opening in top of pedal arm.

(9) Push cable retainer (clip) into pedal arm opening until it snaps in place.

(10) Snap cable into plenum routing clip.

(11) Install air box to throttle body.

(12) Before starting engine, operate accelerator pedal to check for any binding.

THROTTLE POSITION SENSOR

DESCRIPTION

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade.

OPERATION

The TPS is a 3-wire variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance (output voltage) of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the

THROTTLE POSITION SENSOR (Continued)

PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
- Deceleration fuel lean out
- Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
- A/C WOT cutoff (certain automatic transmissions only)

REMOVAL - 4.0L

The TPS is mounted to the throttle body.

- (1) Disconnect TPS electrical connector (Fig. 38).
- (2) Remove TPS mounting screws (Fig. 39).
- (3) Remove TPS.

REMOVAL - 4.7L

The TPS is located on the throttle body.

- (1) Remove air duct and air resonator box at throttle body.
- (2) Disconnect TPS electrical connector (Fig. 34).
- (3) Remove two TPS mounting bolts (screws) (Fig. 40).
- (4) Remove TPS from throttle body.

INSTALLATION - 4.0L

The TPS is mounted to the throttle body.

The throttle shaft end of throttle body slides into a socket in the TPS (Fig. 41). The TPS must be installed so that it can be rotated a few degrees. (If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs). The TPS will be under slight tension when rotated.

- (1) Install TPS and retaining screws.
- (2) Tighten screws to 7 N·m (60 in. lbs.) torque.
- (3) Connect TPS electrical connector to TPS.
- (4) Manually operate throttle (by hand) to check for any TPS binding before starting engine.

INSTALLATION - 4.7L

The throttle shaft end of throttle body slides into a socket in TPS (Fig. 42). The TPS must be installed so that it can be rotated a few degrees. If sensor will not rotate, install sensor with throttle shaft on other side of socket tangs. The TPS will be under slight tension when rotated.

- (1) Install TPS and two retaining bolts.
- (2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
- (3) Manually operate throttle control lever by hand to check for any binding of TPS.
- (4) Connect TPS electrical connector to TPS.
- (5) Install air duct/air box to throttle body.

STEERING

DESCRIPTION - POWER STEERING SYSTEM

The power steering pump (Fig. 2) is a constant flow rate and displacement vane type pump. The pump reservoir is attached to the pump body. The pump is connected to the steering by the pressure and return hoses. The steering gear (Fig. 2) used is a recirculating ball type gear. A tilt and non-tilt column provide steering input.

The power steering system consists of:

- Hydraulic pump
- Recirculating ball steering gear
- Steering column
- Steering linkage
- Cooler (optional)
- Fluid in-line filter (4.7L) (Fig. 1)

Fig. 1 FLUID FILTER

80c07226

Fig. 2 Power Steering Gear & Pump

- 1 - STEERING GEAR
- 2 - PRESSURE HOSE
- 3 - PUMP
- 4 - RETURN HOSE
- 5 - RESERVOIR

OPERATION - POWER STEERING SYSTEM

The rack piston balls act as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned from input from the steering column the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which moves the steering linkage.

STEERING (Continued)

DIAGNOSIS AND TESTING - POWER STEERING SYSTEM DIAGNOSIS CHARTS

STEERING NOISE

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	<ol style="list-style-type: none"> 1. Steering intermediate shaft to dash panel seal. 2. Noisy valve in power steering gear. 	<ol style="list-style-type: none"> 1. Check and repair seal at dash panel. 2. Replace steering gear.

DIAGNOSIS AND TESTING - STEERING FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 (Fig. 3) and Adapter Kit 6893.

FLOW AND PRESSURE TEST

- (1) Check the power steering belt to ensure it is in good condition and adjusted properly.
- (2) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6865.
- (3) Connect Adapter 6826 to Power Steering Analyzer test valve end.
- (4) Disconnect the high pressure hose from the power steering pump.
- (5) Connect Tube 6865 to the pump hose fitting.

80ae82e2

Fig. 3 Power Steering Analyzer

- 1 - TUBE
- 2 - ADAPTER FITTINGS
- 3 - ANALYZER
- 4 - GAUGE HOSE

- (6) Connect the power steering hose from the steering gear to Adapter 6826.
- (7) Open the test valve completely.

STEERING (Continued)

(8) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge.

(9) Shut off the engine and check the fluid level, add fluid as necessary. Start engine again and let idle.

(10) The initial pressure reading should be 345-552 kPa (50-80 psi). If pressure is higher inspect the hoses for restrictions and repair as necessary.

(11) Increase the engine speed to 1500 RPM and read the flow meter. The reading should be 2.4 - 2.8 GPM, if the reading is below this specification the pump should be replaced.

CAUTION: This next step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(12) Close valve fully three times for three seconds and record highest pressure indicated each time. **All three readings must be at pump relief pressure specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

(13) Open the test valve and turn the steering wheel to the extreme left and right positions against the stops. Record the highest pressure reading at each position. Compare readings to the pump specifications chart. If pressures readings are not within 50 psi. of each other, the gear is leaking internally and must be repaired.

GEAR INLET SPECIFICATIONS 4.0L & 4.7L

ENGINE	RELIEF PRESSURE \pm 50	FLOW RATE (GPM)
4.0L	9653 kPa (1400 psi)	1500 RPM 2.4 - 2.8 GPM

SERVICE WARNINGS AND CAUTIONS

DESCRIPTION

The tilt column (Fig. 1) has been designed to be serviced as an assembly, less the wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

80b6f0a2

Fig. 1 Steering Column

To service the steering wheel, switches or airbag, (Refer to 8 - ELECTRICAL/RESTRAINTS - WARNING).

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

CAUTION: Safety goggles should be worn at all times when working on steering columns.

REMOVAL

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

COLUMN (Continued)

- (1) Position front wheels straight ahead.
- (2) Disconnect and isolate the negative (ground) cable from the battery.
- (3) Remove the airbag.(Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).
- (4) Remove the steering wheel nut and remove wheel with Puller C-3894-A (Fig. 2).

**Fig. 2 Steering Wheel Puller**

- 1 - PULLER
2 - STEERING WHEEL

NOTE: Ensure the puller jaws are seated in the pockets (Fig. 3) of the steering wheel armature.

- (5) Remove the cluster bezel by pulling it from the instrument panel (Fig. 4).
- (6) Remove the knee blocker cover (Fig. 5).(Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).
- (7) Remove the lower steering column shroud mounting screw (Fig. 6).
- (8) Unsnap the two halves of the column shrouds by pressing on the sides of the upper shroud and tilting the rear of the upper shroud up. Remove the shrouds from the steering column (Fig. 7).
- (9) Remove the upper fixed shroud mounting screws and remove the shroud (Fig. 8).
- (10) Disconnect the multifunction switch (Fig. 9) and ignition switch harness.
- (11) Remove the multifunction switch screw from underneath the switch (Fig. 10). Slide the multifunction switch and clock spring off the column as an assembly (Fig. 11).

IGNITION SWITCH

DESCRIPTION

The electrical ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key lock cylinder is used to engage/disengage the electrical ignition switch.

DIAGNOSIS AND TESTING - IGNITION SWITCH

ELECTRICAL DIAGNOSIS

For ignition switch electrical schematics, refer to Ignition Switch in Wiring Diagrams.

MECHANICAL DIAGNOSIS (KEY DIFFICULT TO ROTATE)

Vehicles equipped with an automatic transmission and a floor mounted shifter: a cable is used to connect the interlock device in the steering column assembly, to the transmission floor shift lever. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is rotated to the LOCKED or ACCESSORY position. The interlock device within the steering column is not serviceable. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

If the ignition key is difficult to rotate to or from the LOCK or ACCESSORY position, it may not be the fault of the key cylinder or the steering column components. The brake transmission shift interlock cable may be out of adjustment. Refer to Brake Transmission Shift Interlock Cable Adjustment in Transmissions for adjustment procedures.

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the steering column. This interlock device is used to lock the transmission shifter in the PARK position when the key lock cylinder is in the LOCKED or ACCESSORY position. If it is difficult to rotate the key to or from

the LOCK or ACCESSORY position, the interlock device within the steering column may be defective. This device is not serviceable. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

Vehicles equipped with a manual transmission and a floor mounted shifter: on certain models, a lever is located on the steering column behind the ignition key lock cylinder. The lever must be manually operated to allow rotation of the ignition key lock cylinder to the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lever mechanism may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

On other models, the ignition key cylinder must be depressed to allow it to be rotated into the LOCK or ACCESSORY position. If it is difficult to rotate the key to the LOCK or ACCESSORY position, the lock mechanism within the steering column may be defective. This mechanism is not serviceable. If repair is necessary, the steering column assembly must be replaced, (Refer to 19 - STEERING/COLUMN - REMOVAL).

IGNITION SWITCH REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Remove key cylinder. Refer to previous steps.
- (2) Remove lower steering column cover screws and remove cover (Fig. 19).
- (3) Remove ignition switch mounting screw (Fig. 17). Use tamper proof torx bit to remove the screw.
- (4) Using a small screwdriver, push on locking tab (Fig. 15) and remove switch from steering column.
- (5) Disconnect two electrical connectors at rear of ignition switch (Fig. 17).

IGNITION SWITCH INSTALLATION

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Before installing ignition switch, rotate the slot in the switch to the ON position (Fig. 16).
- (2) Connect two electrical connectors to rear of ignition switch. Make sure that locking tabs are fully seated into wiring connectors.
- (3) Position switch to column and install tamper proof screw. Tighten screw to 3 N-m (26 in. lbs.).
- (4) Install steering column lower cover.

KEY-IN IGNITION SWITCH

DESCRIPTION

The key-in ignition switch is concealed within and integral to the ignition switch, which is mounted on the steering column. The key-in ignition switch is actuated by the ignition lock cylinder mechanism, and is hard wired between a body ground and the

Body Control Module (BCM) through the instrument panel wire harness.

The key-in ignition switch cannot be adjusted or repaired and, if faulty or damaged, the entire ignition switch unit must be replaced. (Refer to 19 - STEERING/COLUMN/LOCK CYLINDER HOUSING - REMOVAL). For complete circuit diagrams, refer to **Body Control Module** in the Contents of Wiring Diagrams.

OPERATION

The key-in ignition switch closes a path to ground for the BCM when the ignition key is inserted in the ignition lock cylinder, and opens the ground path when the key is removed from the ignition lock cylinder. The BCM monitors the key-in ignition switch status through an internal pull-up, then sends the proper switch status messages to other electronic modules over the Programmable Communications Interface (PCI) data bus network. The key-in ignition switch status is also used by the BCM as an input for chime warning system operation.

DIAGNOSIS AND TESTING — KEY-IN IGNITION SWITCH

For complete circuit diagrams, refer to **Body Control Module** in the Contents of Wiring Diagrams.

KEY-IN IGNITION SWITCH (Continued)

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable. Disconnect the instrument panel wire harness connector from the key-in ignition switch connector receptacle on the ignition switch. Check for continuity between the key-in ignition switch sense and ground terminals of the key-in ignition switch connector receptacle. There should be continuity with the key inserted in the ignition lock cylinder, and no continuity with the key removed from the ignition lock cylinder. If OK, go to Step 2. If not OK, replace the faulty ignition switch unit.

(2) Check for continuity between the ground circuit cavity of the instrument panel wire harness connector for the key-in ignition switch and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open ground circuit to ground as required.

(3) Disconnect the gray 26-way instrument panel wire harness connector from the Body Control Module (BCM) connector receptacle. Check for continuity between the key-in ignition switch sense circuit cavity of the instrument panel wire harness connector for the key-in ignition switch and a good ground. There should be no continuity. If OK, go to Step 4. If not OK, repair the shorted key-in ignition switch sense circuit as required.

(4) Check for continuity between the key-in ignition switch sense circuit cavities of the instrument panel wire harness connector for the key-in ignition switch and the gray 26-way instrument panel wire harness connector for the BCM. There should be continuity. If OK, use a DRB scan tool and the proper Diagnostic Procedures manual to test the BCM. If not OK, repair the open key-in ignition switch sense circuit as required.

(4) A release tang is located on bottom of key cylinder (Fig. 18).

80a43756

LOCK CYLINDER HOUSING

KEY CYLINDER REMOVAL

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

- (1) Disconnect negative battery cable at battery.
- (2) If equipped with an automatic transmission, place shifter in PARK position.
- (3) Rotate key to ON position.

(5) Position a small screwdriver or pin punch into tang access hole on bottom of steering column lower cover (Fig. 19).

(6) Push the pin punch up while pulling key cylinder from steering column.

LOCK CYLINDER HOUSING (Continued)

KEY CYLINDER INSTALLATION

The ignition key must be in the key cylinder for cylinder removal. The key cylinder must be removed first before removing ignition switch.

(1) If equipped with an automatic transmission, place shifter in PARK position.

(2) Position key cylinder into steering column as it would normally be in the ON position.

(3) Press key cylinder into column until it snaps into position.

(4) Check mechanical operation of switch. **Automatic Transmission:** Be sure transmission lever is locked in PARK position after key removal. If key is difficult to rotate or is difficult to remove, the shift lever-to-steering column cable may be out of adjustment or defective. Refer to Transmission for procedures. **Manual Transmission:** Be sure key cannot be removed until release lever is operated. If key can be removed, release lever mechanism may be defec-

tive. Release lever mechanism is not serviced separately. If repair is necessary, the steering column must be replaced,(Refer to 19 - STEERING/COLUMN - REMOVAL).

(5) Connect negative cable to battery.

(6) Check electrical operation of switch.

STEERING WHEEL

REMOVAL

For steering wheel removal procedure,(Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL) .

INSTALLATION

For steering wheel installation procedure,(Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - INSTALLATION).

GEAR

DESCRIPTION

The power steering gear is a recirculating ball type gear (Fig. 1).

The following gear components can be serviced:

- Pitman Shaft and Cover
- Pitman Shaft Bearings
- Pitman Shaft Oil Seal/Dust Seal
- Stud Shaft Housing with Seal
- O-Rings and Teflon Rings

NOTE: If rack piston assembly is damaged the gear must be replaced.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

REMOVAL

(1) Place the front wheels in the straight ahead position with the steering wheel centered and locked.

(2) Remove the air cleaner housing,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

(3) Drain or siphon the power steering system.

(4) Remove the pressure and return lines (Fig. 2)from the steering gear. Refer to hose removal in this section.

(5) Remove the column coupler shaft bolt (Fig. 2)and remove the shaft from the gear.

(6) Raise and support the vehicle.

(7) Remove the left front wheel and tire assembly.

(8) Remove the pitman arm from gear with Puller C-4150A .

(9) Remove the windshield washer reservoir,(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).

(10) Remove the steering gear mounting bolts. Remove the steering gear out of the engine compartment (Fig. 3).

INSTALLATION

(1) Position the steering gear on the frame rail and install the bolts. Tighten the bolts to 108 N·m (80 ft. lbs.) torque.

(2) Install the pitman arm and tighten nut to 251 N·m (185 ft. lbs.).

(3) Install windshield washer reservoir,(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).

(4) Install the wheel and tire assembly.

(5) Remove the support and lower the vehicle.

(6) Install the pressure and return hoses to the steering gear and tighten to 20-38 N·m (14-28 ft. lbs.).

(7) Install the column coupler shaft.

(8) Install the air cleaner housing,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

(9) Fill the power steering pump.

GEAR (Continued)

ADJUSTMENTS — STEERING GEAR

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

OVER-CENTER

(1) Rotate the stub shaft with Socket 8343 from stop to stop and count the number of turns.

(2) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

(3) Place torque wrench and Socket 8343 in a vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 4). This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

(4) Rotate the stub shaft between 90° and 180° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.45-0.80 N·m (4-7 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw **CLOCKWISE**.

80b34e43

Fig. 4 Checking Over-center Rotation Torque

1 - CENTER

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 37-52 N·m (27-38 ft. lbs.).

SPECIFICATIONS

POWER STEERING GEAR

SPECIFICATIONS

PITMAN SHAFT

REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Remove preload adjuster nut (Fig. 5).

**Driver 8277****Driver 8294****Socket 8343**

- (3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.
- (4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.
- (5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 5).

NOTE: The pitman shaft will not clear the housing if it is not centered.

- (6) Remove pitman shaft from the side cover.
- (7) Remove dust seal from the housing with a seal pick (Fig. 6).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

- (8) Remove retaining ring with snap ring pliers.
- (9) Remove washer from the housing.

- 3 - DUST SEAL
- 4 - RETAINER
- 5 - OIL SEAL

(10) Remove oil seal from the housing with a seal pick.

(11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 7).

J9319-42

Fig. 7 Needle Bearing Removal

- 1 - REMOVER
- 2 - SIDE COVER AREA

INSTALLATION

(1) Install pitman shaft bearing into housing with a bearing driver and handle.

(2) Coat the oil seal and washer with **special grease** supplied with the new seal.

(3) Install the oil seal with a driver and handle.

(4) Install backup washer.

(5) Install the retainer ring with snap ring pliers.

(6) Coat the dust seal with **special grease** supplied with the new seal.

(7) Install dust seal with a driver and handle.

(8) Install pitman shaft to side cover by screwing shaft in until it fully seats to side cover.

(9) Install preload adjuster nut. **Do not tighten nut until after Over-Center Rotation Torque adjustment has been made.**

(10) Install gasket to side cover and bend tabs around edges of side cover (Fig. 5).

(11) Install pitman shaft assembly and side cover to housing.

(12) Install side cover bolts and tighten to 60 N·m (44 ft. lbs.).

(13) Perform over-center rotation torque adjustment.

PITMAN BEARING

REMOVAL

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Rotate the stub shaft with a wrench (Fig. 8) from stop to stop and count the number of turns.
- (3) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

NOTE: The pitman shaft will not clear the housing if it is not centered.

Fig. 8 Center Stub

- 1 - WRENCH
- 2 - STUB SHAFT

- (4) Remove pitman shaft cover bolts and remove the shaft assembly (Fig. 9).
- (5) Remove pitman shaft cover o-ring.
- (6) Remove pitman shaft dust seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 10).
- (7) Remove the pitman shaft oil seal retaining ring with snap ring pliers (Fig. 11).
- (8) Remove oil seal metal backup washer then plastic backup washer from the housing (Fig. 12).
- (9) Remove pitman shaft oil seal from the housing with a Puller 7794-A and Slide Hammer C-637 (Fig. 13).
- (10) Drop Driver 8277 through the top bearing and align the driver up with the lower bearing. (Fig. 14). Install Handle C-4171 into the driver and remove the lower bearing.

3 - DRIVER

(11) Turn the gear over and remove the upper bearing with Driver 8277 and Handle C-4171.

INSTALLATION

(1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 15). Drive bearing into housing until the driver bottoms out.

NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.

(2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 16). Drive bearing into housing until the bearing shoulder is seated against the housing.

(3) Coat the oil seal and backup washers with **special greases** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

- (6) Install metal backup washer.
(7) Install the retainer ring with snap ring pliers.
(8) Coat the dust seal with **special grease** supplied with the new seal.
(9) Install dust seal with Driver 8294 and Handle C-4171.
(10) Install new pitman shaft cover o-ring.
(11) Install pitman shaft assembly into the housing.
(12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).
(13) Perform over-center rotation torque adjustment.

PITMAN SHAFT SEAL

REMOVAL

(1) Clean exposed end of pitman shaft and housing with a wire brush.

(2) Rotate the stub shaft with a wrench (Fig. 17) from stop to stop and count the number of turns.

(3) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

NOTE: The pitman shaft will not clear the housing if it is not centered.

INSTALLATION

(1) Install upper pitman shaft bearing, with Driver 8294 and Handle C-4171 (Fig. 24). Drive bearing into housing until the driver bottoms out.

NOTE: Install upper pitman shaft bearing with the part number/letters facing the driver.

(2) Install lower pitman shaft bearing with the other side Driver 8294 and Handle C-4171 (Fig. 25). Drive bearing into housing until the bearing shoulder is seated against the housing.

(3) Coat the oil seal and backup washers with **special grease** supplied with the new seal.

(4) Install the oil seal with Driver 8294 and Handle C-4171.

(5) Install plastic backup washer.

NOTE: The plastic backup washer has a lip on the inside diameter that faces down towards the oil seal.

(6) Install metal backup washer.

(7) Install the retainer ring with snap ring pliers.

(8) Coat the dust seal with **special grease** supplied with the new seal.

(9) Install dust seal with Driver 8294 and Handle C-4171.

PITMAN SHAFT SEAL (Continued)

- (10) Install new pitman shaft cover o-ring.
- (11) Install pitman shaft assembly into the housing.
- (12) Install cover bolts and tighten to 62 N·m (46 ft. lbs.).
- (13) Perform over-center rotation torque adjustment.

SPOOL VALVE

REMOVAL

- (1) Remove lock nut (Fig. 26).
- (2) Remove adjuster nut with Spanner Wrench C-4381.
- (3) Remove thrust support assembly out of the housing (Fig. 27).
- (4) Pull stub shaft and valve assembly from the housing (Fig. 28).

Fig. 26 Lock Nut and Adjuster Nut

- 1 - ADJUSTER NUT
- 2 - STEERING GEAR
- 3 - LOCK NUT
- 4 - PUNCH

(5) Remove stub shaft from valve assembly by lightly tapping shaft on a block of wood to loosen shaft. Then disengage stub shaft pin from hole in spool valve and separate the valve assembly from stub shaft (Fig. 29).

(6) Remove spool valve from valve body by pulling and rotating the spool valve from the valve body (Fig. 30).

(7) Remove spool valve O-ring and valve body teflon rings and O-rings underneath the teflon rings (Fig. 31).

(8) Remove the O-ring between the worm shaft and the stub shaft.

- 6 - VALVE ASSEMBLY

INSTALLATION

NOTE: Clean and dry all components, then lubricate with power steering fluid.

- (1) Install spool valve spool O-ring.
- (2) Install spool valve in valve body by pushing and rotating. Hole in spool valve for stub shaft pin must be accessible from opposite end of valve body.

SPOOL VALVE (Continued)

NOTE: Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.

(3) Install stub shaft in valve spool and engage locating pin on stub shaft into spool valve hole (Fig. 32).

J9319-38

Fig. 32 Stub Shaft Installation

- 1 - NOTCH IN CAP
- 2 - VALVE BODY PIN

(4) Install O-rings and teflon rings over the O-rings on valve body.

(5) Install O-ring into the back of the stub shaft cap (Fig. 33).

SPOOL VALVE (Continued)

Fig. 33 Stub Shaft Cap O-Ring

- 1 - VALVE BODY
- 2 - STUB SHAFT CAP
- 3 - O-RING

(6) Install stub shaft and valve assembly in the housing. Line up worm shaft to slots in the valve assembly.

NOTE: The thrust support is serviced as an assembly. If any component of the thrust support is damaged the assembly must be replaced.

- (7) Install thrust support assembly.
- (8) Install adjuster nut and lock nut.
- (9) Adjust Thrust Bearing Preload and Over-Center Rotating Torque.

STEERING GEAR HOUSING PLUG

REMOVAL

- (1) Unseat and remove retaining ring from groove with a punch through the hole in the end of the housing (Fig. 34).
- (2) Slowly rotate stub shaft with 12 point socket COUNTER-CLOCKWISE to force the end plug out from housing.

CAUTION: Do not turn stub shaft any further than necessary. The rack piston balls will drop out of the rack piston circuit if the stub shaft is turned too far.

(3) Remove O-ring from the housing (Fig. 35).

INSTALLATION

- (1) Lubricate O-ring with power steering fluid and install into the housing.
- (2) Install end plug by tapping the plug lightly with a plastic mallet into the housing.

Fig. 34 End Plug Retaining Ring

- 1 - RETAINING RING

Fig. 35 End Plug Components

WORM SHAFT

REMOVAL

- (1) Remove housing end plug.
- (2) Remove rack piston plug (Fig. 37).
- (3) Remove side cover and pitman shaft.

**Fig. 37 Rack Piston End Plug**

- 1 - EXTENSION
- 2 - END PLUG
- 3 - RACK PISTON
- 4 - RATCHET

(4) Turn stub shaft COUNTERCLOCKWISE until the rack piston begins to come out of the housing.

(5) Insert Arbor C-4175 into bore of rack piston (Fig. 38) and hold tool tightly against worm shaft.

(6) Turn the stub shaft with a 12 point socket COUNTERCLOCKWISE, this will force the rack piston onto the tool and hold the rack piston balls in place.

**Fig. 38 Rack Piston with Arbor**

- 1 - RACK PISTON
- 2 - SPECIAL TOOL C-4175

(7) Remove the rack piston and tool together from housing.

(8) Remove tool from rack piston.

(9) Remove rack piston balls.

(10) Remove clamp bolts, clamp and ball guide (Fig. 39).

(11) Remove teflon ring and O-ring from the rack piston (Fig. 40).

(12) Remove the adjuster lock nut and adjuster nut from the stub shaft.

(13) Pull the stub shaft with the spool valve and thrust support assembly out of the housing.

(14) Remove the worm shaft from the housing (Fig. 41).

INSTALLATION

NOTE: Clean and dry all components and lubricate with power steering fluid.

(1) Check for scores, nicks or burrs on the rack piston finished surface. Slight wear is normal on the worm gear surfaces.

(2) Install O-ring and teflon ring on the rack piston.

WORM SHAFT (Continued)

- 3 - RACK PISTON NUT

(3) Install worm shaft in the rack piston and align worm shaft spiral groove with rack piston ball guide hole (Fig. 42).

CAUTION: The rack piston balls must be installed alternately into the rack piston and ball guide. This maintains worm shaft preload. There are 12 black balls and 12 silver (Chrome) balls. The black balls are smaller than the silver balls.

J9319-39

Fig. 42 Installing Balls in Rack Piston

- 1 - INSTALL BALLS IN THIS HOLE WHILE SLOWLY ROTATING WORM COUNTERCLOCKWISE
- 2 - WORM FLANGE

(4) Lubricate and install rack piston balls through return guide hole while turning worm shaft COUNTERCLOCKWISE (Fig. 42).

(5) Install remaining balls in guide using grease to hold the balls in place (Fig. 43).

(6) Install the guide onto rack piston and install clamp and clamp bolts. Tighten bolts to 4.8 N-m (43 in. lbs.).

(7) Insert Arbor C-4175 into bore of rack piston and hold tool tightly against worm shaft.

(8) Turn the worm shaft COUNTERCLOCKWISE while pushing on the arbor. This will force the rack piston onto the arbor and hold the rack piston balls in place.

WORM SHAFT (Continued)

J9319-40

Fig. 43 Balls in the Return Guide

- 1 - GUIDE
- 2 - PETROLEUM JELLY
- 3 - BALLS

(9) Install the races and thrust bearing on the worm shaft and install shaft in the housing (Fig. 41).

(10) Install the stub shaft with spool valve, thrust support assembly and adjuster nut in the housing.

(11) Install the rack piston and arbor tool into the housing.

(12) Hold arbor tightly against worm shaft and turn stub shaft **CLOCKWISE** until rack piston is seated on worm shaft.

(13) Install pitman shaft and side cover in the housing.

(14) Install rack piston plug and tighten to 150 N·m (111 ft. lbs.).

(15) Install housing end plug.

(16) Adjust worm shaft thrust bearing preload and over-center rotating torque.

LINKAGE

DESCRIPTION

The steering linkage consists of a pitman arm, drag link, tie rod, and steering dampener (Fig. 1). An adjustment sleeve on the tie rod is used to set wheel toe position. The sleeve on the drag link is used for steering wheel centering.

CAUTION: If any steering components are replaced or serviced an alignment must be performed, to ensure the vehicle meets all alignment specifications.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

DAMPER

DESCRIPTION

The damper is mounted to the axle housing and the tie rod end. The damper consists of steel tube shock absorber with a permanent bushed end.

OPERATION

The steering damper provides steering system damping.

REMOVAL

- (1) Remove the nut from the ball stud at the tie rod.
- (2) Remove the steering damper from the tie rod.
- (3) Remove the steering damper nut and bolt from the axle bracket (Fig. 2).

INSTALLATION

- (1) Install the steering damper to the axle bracket and tie rod.
- (2) Install the steering damper bolt in the axle bracket and tighten bolt to 88 N·m (65 ft. lbs.).
- (3) Install the nut at the tie rod and tighten to 41 N·m (30 ft. lbs.).

DRAG LINK

DESCRIPTION

The drag link and ends are comprised of two forged ends connected by a steel adjusting tube. The drag link connects the steering gear pitman arm to the steering knuckle. The larger offset end is attached to the pitman arm.

OPERATION

The sleeve is used for steering wheel centering.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove right wheel and tire assembly.
- (3) Remove the cotter pins and nuts at the right steering knuckle and pitman arm (Fig. 3).
- (4) Remove the drag link from the steering knuckle and pitman arm Puller C-3894-A.
- (5) Loosen adjustment sleeve clamp bolts and unscrew the tie rod ends from the adjustment sleeve.

INSTALLATION

- (1) Screw the tie rod ends into the adjustment sleeve.
- (2) Install the drag link onto the right steering knuckle and pitman arm.
- (3) Tighten the nut at the steering knuckle to 47 N·m (35 ft. lbs.). Tighten the pitman nut to 88 N·m (65 ft. lbs.). Install new cotter pins.
- (4) Position clamp bolts to their original position and tighten to 41 N·m (30 ft. lbs.).
- (5) Install right wheel and tire assembly.
- (6) Remove support and lower the vehicle.
- (7) Center the steering wheel.

PITMAN ARM

DESCRIPTION

The pitman arm is attached at one end of the steering gear's sector shaft. The other end is connected to the drag link.

OPERATION

The pitman arm transfers rotary motion into side to side motion.

REMOVAL

- (1) Remove the cotter pin and nut from the drag link at the pitman arm (Fig. 4).
- (2) Remove the drag link ball stud from the pitman arm with a puller.
- (3) Remove the nut and washer from the steering gear shaft. Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from steering gear with Puller C-4150A.

INSTALLATION

- (1) Align and install the pitman arm on steering gear shaft.
- (2) Install the washer and nut on the shaft and tighten the nut to 251 N·m (185 ft. lbs.).
- (3) Install drag link ball stud to pitman arm. Install nut and tighten to 88 N·m (65 ft. lbs.). Install a new cotter pin.

TIE ROD END (Continued)

**Fig. 4 Pitman Arm**

- 1 - STEERING GEAR
- 2 - PITMAN ARM

TIE ROD END

DESCRIPTION

The ends are forged, with a lubed for life ball socket.

OPERATION

The tie rod ends connect the drag link to the wheel assembly. The tie rod provides toe alignment and transfers steering input from the drag link to the wheels.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove wheel and tire assemblies.
- (3) Remove the damper nut from the tie rod clamp (Fig. 5).
- (4) Remove the damper from the tie rod.
- (5) Remove the cotter pins and nuts from the tie rod ends at the steering knuckles (Fig. 5).
- (6) Remove the tie rod ends from the steering knuckles with Puller C-3894-A.

- (7) Loosen the adjustment sleeve clamp bolts and unscrew the tie rod ends from the sleeve.

**Fig. 5 Tie Rod Assembly**

- 1 - TIE ROD END
- 2 - CLAMP
- 3 - DAMPER
- 4 - TIE ROD
- 5 - CLAMP
- 6 - TIE ROD END

INSTALLATION

- (1) Screw the tie rod ends into the adjustment sleeve.
- (2) Install the tie rod on the steering knuckles and install the nuts.
- (3) Tighten the nuts to 47 N·m (35 ft. lbs.). Install new cotter pins and bend end 60°.
- (4) Position the adjustment sleeve clamp bolts to their original location and tighten to 41 N·m (30 ft. lbs.).
- (5) Install the damper on the tie rod and install the nut.
- (6) Tighten the nut to 41 N·m (30 ft. lbs.). Install new cotter pins and bend end 60°.
- (7) Install wheel and tire assemblies.
- (8) Remove support and lower the vehicle.
- (9) Perform toe position adjustment.

PUMP

DESCRIPTION - 4.7L

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (Fig. 1). The pump shaft has a pressed-on drive pulley that is belt driven by the crankshaft pulley.

DESCRIPTION - 4.0L

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (Fig. 2). The pump shaft has a pressed-on drive pulley that is belt driven by the crankshaft pulley.

DESCRIPTION - POWER STEERING/RADIATOR COOLING FAN FLUID FILTER

There is a in-line fluid filter located between the steering gear and the power steering fluid oil cooler (Fig. 3). This filter is designed for the life of the vehicle. However, some conditions may cause the filter to reach its capacity prematurely. Because the filter has a built-in bypass function that activates when the filter becomes plugged, a plugged filter can not be detected. Because of this, the filter must be replaced whenever there is a failure of any component of the hydraulic system (i.e. steering gear, power steering pump or hydraulic fan drive). The filter should also be replaced on any vehicle that contains excessive amounts of dust or dirt in the power steering fluid.

OPERATION - 4.7L

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump has

internal parts that operate submerged in fluid. The flow control orifice is part of the high pressure line quick connect fitting. The pressure relief valve inside the flow control orifice and the pressure relief valve, which limits the pump pressure, are internal to the pump. The reservoir is attached to the pump body with spring clips. The power steering pump is used to drive the hydraulic engine cooling fan, which separates the flow to the fan gerotors and the power steering gear. The power steering pump is connected to the engine cooling fan by pressure and return hoses and the pump is connected to the steering gear via a return hose from the steering cooler.

NOTE: Power steering pumps have different pressure rates and are not interchangeable with other pumps.

OPERATION - 4.0L

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure. The reservoir is attached to the pump body with spring clips. The power steering pump is connected to the steering gear by the pressure and return hoses.

NOTE: Power steering pumps have different pressure rates and are not interchangeable with other pumps.

- 2 - Cap
- 3 - Fluid Reservoir
- 4 - Low-Pressure Return From The Filter
- 5 - Low-Pressure Return From The Hydraulic Fan Drive
- 6 - Pump Body

OPERATION - POWER STEERING/RADIATOR COOLING FAN FLUID FILTER

The filter is designed to last the life of the vehicle. However, some conditions can cause the filter to become plugged prematurely thus causing the fluid to by-pass the filter element because of the built-in by-pass in the filter housing. Because of the built-in by-pass a plugged filter can not be detected, therefore, the filter must be replaced if any failure within the hydraulic system occurs. The filter should also be replaced if the power steering fluid becomes contaminated with excessive dust or dirt.

Power Steering Pump

STANDARD PROCEDURES - INITIAL OPERATION - 4.0L

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

- (1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
- (2) Start the engine and let run for a few seconds then turn engine off.
- (3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.
- (4) Raise the front wheels off the ground.
- (5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.
- (6) Check the fluid level add if necessary.
- (7) Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.

(8) Stop the engine and check the fluid level and refill as required.

(9) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

STANDARD PROCEDURES - INITIAL OPERATION - 4.7L

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

- (1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
- (2) Start the engine and let run for a few seconds then turn engine off.
- (3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.
- (4) Raise the front wheels off the ground.
- (5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.
- (6) Check the fluid level add if necessary.
- (7) Lower the vehicle, start the engine, and use the DRB III to activate the hydraulic fan on full fan operation.
- (8) Turn the steering wheel slowly from lock to lock.
- (9) Stop the engine, check the fluid level and refill as required and repeat the process
- (10) Check the fluid level add if necessary.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

(11) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

(12) While the vehicle is in park, use the DRB III to activate the hydraulic fan to full fan operation and briefly rev the engine up to 3000 rpm to fully engage the hydraulic fan.

(13) Check the fluid level add if necessary.

PUMP (Continued)

REMOVAL - 4.0L ENGINE

- (1) Remove serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (2) Remove pressure and return hoses from pump and drain the pump.
- (3) Loosen the pump bracket bolt at the engine block.
- (4) Remove 3 pump mounting bolts (Fig. 4) through pulley access holes.
- (5) Tilt pump downward and remove from engine.
- (6) Remove pulley from pump.

**Fig. 4 PUMP MOUNTING - 4.0L**

- 1 - PUMP ASSEMBLY
2 - PUMP BRACKET

REMOVAL - 4.7L ENGINE

- (1) Remove the serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
- (2) Remove the pressure and return hoses from pump and drain pump.
- (3) Remove 3 pump mounting bolts through pulley access holes (Fig. 5).
- (4) Remove the pump from the vehicle.

80b89871

Fig. 5 Pump Mounting

- 1 - LEFT CYLINDER HEAD
2 - PUMP

INSTALLATION - 4.0L ENGINE

- (1) Install pulley on pump.
- (2) Install pump on the engine mounting bracket.
- (3) Install 3 pump mounting bolts and tighten to 27 N·m (20 ft. lbs.).
- (4) Tighten pump bracket bolt to 57 N·m (42 ft. lbs.).
- (5) Install the pressure line on the pump and tighten to 28 N·m (21 ft. lbs.).
- (6) Install the return hoses on pump.
- (7) Install the drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (8) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

INSTALLATION - 4.7L ENGINE

- (1) Position the pump on the left cylinder head and install bolts through pulley access holes. Tighten bolts to 28 N·m (21 ft. lbs.).
- (2) Install the pressure and return hoses to pump.
- (3) Install serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
- (4) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

REMOVAL

- (1) Drain the power steering fluid out of the reservoir.
- (2) Remove the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Remove the high pressure power steering line from the steering gear.
- (4) Disconnect the low pressure return line from the power steering gear.
- (5) Remove the front fascia grille,(Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (6) Remove the power steering cooler from the vehicle (Fig. 6).

Fig. 6 COOLER REMOVAL

INSTALLATION

- (1) Install the power steering cooler to the vehicle (Fig. 7).

Fig. 7 COOLER INSTALL

- (2) Install the front fascia grille,(Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

- (3) Reconnect the low pressure return line to the power steering gear.

- (4) Install the high pressure power steering line to the steering gear.

- (5) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

- (6) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

HOSES

DESCRIPTION - PRESSURE LINE

The hose consists of two metal ends and rubber center section that contains a tuning cable. The pump end uses a quick connect fitting. Lubrication must be used on the quick connect nut and o-ring when installing.

DESCRIPTION - RETURN LINE

Power steering return line is a hose which is clamped at the pump and the gear.

OPERATION - PRESSURE LINE

Power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the power steering gear on the 4.0L. The 4.7L power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the engine cooling fan and the steering gear, the line also uses an in-line fluid filter to filter contaminants (Fig. 8).

Fig. 8 FLUID FILTER

HOSES (Continued)

OPERATION - RETURN LINE

Power steering return line, is used to transfer low pressure power steering fluid, from the power steering gear to the power steering pump.

REMOVAL

- (1) Drain the power steering fluid from the reservoir.
- (2) Remove the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
- (3) Disconnect the power steering pressure hose from the power steering pump and then the power steering gear (Fig. 9).
- (4) Disconnect the power steering return hose from the power steering cooler and the reservoir.

Fig. 9 POWER STEERING HOSES

- 1 - RETURN HOSE
2 - HIGH PRESSURE HOSE
3 - STEERING GEAR

- (5) Remove the hoses from the vehicle.

INSTALLATION

- (1) Install the hoses to the vehicle.
- (2) Reconnect the power steering return hose to the power steering cooler and the reservoir.
- (3) Reconnect the power steering pressure hose to the power steering pump and then the power steering gear.
- (4) Install the air box,(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
- (5) Refill the power steering fluid and bleed the system,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

PULLEY

REMOVAL

CAUTION: On vehicles equipped with the 4.0L or 4.7L, Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

- (1) Remove pump assembly.
- (2) Remove pulley from pump with Puller C-4333 or equivalent puller (Fig. 10).

Fig. 10 Pulley Removal

- 1 - POWER STEERING PUMP DRIVE PULLEY
2 - SPECIAL TOOL C-4333

INSTALLATION

NOTE: The pulley is marked front for installation.

CAUTION: On vehicles equipped with the 4.0L or 4.7L, Do not reuse the old power steering pump pulley it is not intended for reuse. A new pulley must be installed if removed.

- (1) Replace pulley if bent, cracked, or loose.
- (2) Install pulley on pump with Installer C-4063-B or equivalent installer (Fig. 11). The front edge of the pulley hub must be flush with the end of the shaft. Ensure the tool and pulley are aligned with the pump shaft.
- (3) Install pump assembly.
- (4) With Serpentine Belt, run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

RESERVOIR

REMOVAL

- (1) Remove power steering pump.
- (2) Clean exterior of pump.
- (3) Clamp the pump body in a soft jaw vice.

NOTE: Use new retaining clips for installation.

- (4) Pry up tab and slide the retaining clips off (Fig. 12).
- (5) Remove fluid reservoir from pump body. Remove and discard O-ring seal.

INSTALLATION

- (1) Lubricate new O-ring Seal with Mopar Power Steering Fluid or equivalent.
- (2) Install O-ring seal in housing.
- (3) Install reservoir onto housing.
- (4) Slide and tap in **new** reservoir retainer clips until tab locks to housing.
- (5) Install power steering pump.
- (6) Add power steering fluid,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

TRANSFER CASE - NV242

DESCRIPTION

The NV242 is a full transfer case (Fig. 1). It provides full time 2-wheel, or 4-wheel drive operation.

A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

TRANSFER CASE IDENTIFICATION

Two versions of the NV242 are used in the WJ vehicles, NV242LD and NV242HD. The two transfer cases can be distinguished from one another by the rear output shaft retainer. The NV242LD uses a rubber boot to cover the rear output shaft, while the NV242HD uses a cast aluminum housing. Other than this difference, the two transfer cases are serviced the same.

J8921-243

Fig. 1 NV242 Transfer Case

TRANSFER CASE - NV242 (Continued)

A circular ID tag is attached to the rear case of each transfer case (Fig. 2). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

80b09a60

Fig. 2 Fill/Drain Plug And I.D. Tag Locations

- 1 - I.D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

SHIFT MECHANISM

Operating ranges are selected with a lever in the floor mounted shifter assembly. The shift lever is connected to the transfer case range lever by an adjustable cable. A straight line shift pattern is used. Range positions are marked on the shifter bezel.

OPERATION

The input gear is splined to the transmission output shaft. It drives the mainshaft through the planetary gear and range hub. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchro mechanism for shifting.

OPERATING RANGES

NV242 operating ranges are 2WD (2-wheel drive), 4x4 part-time, 4x4 full time, and 4 Lo.

The 2WD and 4x4 full time ranges can be used at any time and on any road surface.

The 4x4 part-time and 4 Lo ranges are for off road use only. The only time these ranges can be used on hard surface roads, is when the surface is covered with snow and ice.

DIAGNOSIS AND TESTING - TRANSFER CASE - NV242**DIAGNOSIS CHART**

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case shift linkage binding.	1) Repair or replace linkage as necessary.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct type and quantity of lubricant.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct type and quantity of lubricant.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Transfer case will not shift through 4X4 part time range (light remains on)	1) Incomplete shift due to drivetrain torque load.	1) Momentarily release the accelerator pedal to complete the shift.
	2) Incorrect tire pressure.	2) Correct tire pressure as necessary.
	3) Excessive Tire wear.	3) Correct tire condition as necessary.
	4) Excessive vehicle loading.	4) Correct as necessary.

TRANSFER CASE - NV242 (Continued)

REMOVAL

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove transfer case drain plug and drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember and skid plate, if equipped (Fig. 3).

80ba79c7

Fig. 3 Crossmember Removal

- 1 - CROSSMEMBER
2 - REAR TRANSMISSION MOUNT

(7) Disconnect front/rear propeller shafts at transfer case. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

(8) Disconnect transfer case cable from range lever.

(9) Disconnect transfer case vent hose (Fig. 4) and indicator switch harness, if necessary.

(10) Support transfer case with transmission jack.

(11) Secure transfer case to jack with chains.

(12) Remove nuts attaching transfer case to transmission.

(13) Pull transfer case and jack rearward to disengage transfer case.

(14) Remove transfer case from under vehicle.

TRANSFER CASE - NV242 (Continued)

REAR RETAINER - NV242HD

- (1) Remove extension housing bolts.
- (2) Tap extension housing with plastic or rawhide mallet to loosen sealer (Fig. 10).

**Fig. 10 Remove Extension Housing**

- 1 - EXTENSION HOUSING
- 2 - PLASTIC HAMMER
- 3 - REAR RETAINER

- (3) Separate extension housing from rear retainer.
- (4) Remove rear bearing snap-ring (Fig. 11).

**Fig. 11 Remove the Output Bearing Snap-ring**

- 1 - REAR RETAINER
- 2 - SNAP-RING
- 3 - REAR BEARING

- (5) Remove bolts holding rear retainer to rear case half.

- (6) Loosen rear retainer with pry tool to break sealer bead. Pry only against retainer boss as shown (Fig. 12).

**Fig. 12 Loosening Rear Retainer**

- 1 - REAR RETAINER
- 2 - TAB (2)
- 3 - SCREWDRIVER
- 4 - TAB

- (7) Slide retainer off case and output shaft (Fig. 13).

**Fig. 13 Remove Rear Retainer**

- 1 - MAINSHAFT
- 2 - REAR RETAINER

TRANSFER CASE - NV242 (Continued)

OIL PUMP AND REAR CASE HALF

(1) Remove rear bearing O.D. retaining ring with snap ring pliers. Then tilt pump and slide it off output shaft (Fig. 14)

Fig. 14 Oil Pump Removal

1 - OIL PUMP

(2) Remove pickup tube O-ring from pump (Fig. 15) but do not disassemble pump; it is not a repairable part.

(3) Remove seal from oil pump with pry tool.

Fig. 15 Pickup Tube O-Ring Location

1 - OIL PUMP
2 - O-RING

(4) Remove bolts attaching rear case to front case (Fig. 16). Note position of the two black finish bolts at each end of the case. These bolts go through the case dowels and require a washer under the bolt head.

Fig. 16 Spline And Dowel Bolt Locations

1 - DOWEL BOLT AND WASHER (2)
2 - CASE BOLT (5)
3 - SPLINE HEAD BOLT (1)

(5) Remove rear case from front case (Fig. 17). Insert screwdrivers into slots cast into each end of case. Then pry upward to break sealer bead and remove rear case.

CAUTION: Do not pry on the sealing surface of either case half as the surfaces will become damaged.

Fig. 17 Loosening/Removing Rear case

1 - MAINSHAFT
2 - SCREWDRIVER
3 - FRONT CASE
4 - SCREWDRIVER
5 - REAR CASE

TRANSFER CASE - NV242 (Continued)

(6) Remove oil pickup tube and screen from rear case (Fig. 18).

80010979

Fig. 18 Oil Pickup Screen, Hose And Tube Removal

- 1 - CONNECTING HOSE
2 - PICKUP SCREEN
3 - PICKUP TUBE

YOKE AND RANGE LEVER

- (1) Remove front yoke nut:
(a) Move range lever to 4L position.
(b) Remove nut with socket and impact wrench (Fig. 19).

800010957

Fig. 19 Yoke Nut Removal

- 1 - IMPACT WRENCH
2 - SOCKET
3 - YOKE

(2) Remove yoke. If yoke is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller (Fig. 20). Be sure puller tool is positioned on yoke and not on slinger as slinger will be damaged.

80010977

Fig. 20 Yoke Removal

- 1 - PULLER TOOL
2 - YOKE

(3) Remove seal washer from front output shaft. Discard washer as it should not be reused.

(4) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft (Fig. 21).

80010943

Fig. 21 Range Lever Removal

- 1 - RANGE LEVER
2 - SECTOR SHAFT

TRANSFER CASE - NV242 (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Remove drive sprocket snap-ring (Fig. 22).

Fig. 22 Drive Sprocket Snap-Ring Removal

- 1 - DRIVE SPROCKET
2 - DRIVE SPROCKET SNAP-RING

- (2) Remove drive sprocket and chain (Fig. 23).
(3) Remove front output shaft (Fig. 24).

Fig. 23 Drive Sprocket And Chain Removal

- 1 - DRIVE SPROCKET
2 - DRIVE CHAIN

Fig. 24 Removing Front Output Shaft

- 1 - FRONT OUTPUT SHAFT

SHIFT FORKS AND MAINSHAFT

- (1) Remove shift detent plug, spring and pin (Fig. 25).

Fig. 25 Detent Pin, Spring And Plug Removal

- 1 - PLUNGER
2 - O-RING
3 - PLUG
4 - SPRING

TRANSFER CASE - NV242 (Continued)

(2) Remove seal plug from low range fork lockpin access hole. Then move shift sector to align low range fork lockpin with access hole.

(3) Remove range fork lockpin with size number one easy-out tool as follows:

(a) Insert easy-out tool through access hole in side of transfer case and into lock-pin.

(b) Tap easy-out tool into lock-pin with hammer until tool is securely engaged into the lock-pin.

(c) Install a t-handle, such as from a tap and die set, onto the easy-out tool.

(d) Securely tighten the t-handle onto the tool.

(e) In one motion, pull upward and turn the t-handle counter-clockwise to remove the lock-pin.

(4) Remove shift rail by pulling it straight up and out of fork (Fig. 26).

(5) Remove mode fork and mainshaft as assembly (Fig. 27).

(6) Remove mode shift sleeve and mode fork assembly from mainshaft (Fig. 28). Note position of mode sleeve in fork and remove sleeve.

(7) Inspect low range annulus gear (Fig. 42). **Gear is not a serviceable component. If damaged, replace gear and front case as assembly.**

**Fig. 42 Inspecting Low Range Annulus Gear**

- 1 - LOW RANGE ANNULUS GEAR

- (8) Remove oil seals from following components:
- front bearing retainer.
 - rear retainer.
 - oil pump.
 - case halves.

DIFFERENTIAL

- (1) Mark differential case halves for reference.
- (2) Remove differential case bolts.
- (3) Invert differential on workbench.
- (4) Separate top case from bottom case. Use slots in case halves to pry them apart (Fig. 43).
- (5) Remove thrust washers and planet gears from case pins (Fig. 44).
- (6) Remove mainshaft and sprocket gears from bottom case (Fig. 45). Note gear position for reference before separating them.

**Fig. 43 Separating Differential Case Halves**

- 1 - TOP CASE
- 2 - CASE BOLTS
- 3 - CASE BOLTS
- 4 - CASE SLOTS
- 5 - CASE BOLTS

CLEANING

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

TRANSFER CASE - NV242 (Continued)

**Fig. 44 Planet Gears And Thrust Washer Removal**

- 1 - MAINSHAFT GEAR

- 3 - PLANET GEARS (6)

**Fig. 45 Mainshaft And Sprocket Gear Removal**

- 1 - MAINSHAFT GEAR
- 2 - SPROCKET GEAR
- 3 - BOTTOM CASE

INSPECTION**CASES AND FRONT RETAINER**

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite[®] 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil stainless steel inserts if required.

INPUT GEAR

Check the teeth on the gear (Fig. 46). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 47).

MAINSHAFT

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

- 1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

80010948

Fig. 48 Shift Forks

- 1 - RANGE FORK
2 - MODE FORK AND RAIL
3 - MODE SPRING

SHIFT FORK

Check condition of the shift forks and mode fork shift rail (Fig. 48). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads. The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are also serviceable.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

OIL PUMP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do

TRANSFER CASE - NV242 (Continued)

not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

OUTPUT SHAFT SLINGER

Check condition of the seal contact surfaces of the yoke slinger (Fig. 49). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320-400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

REAR RETAINER

Inspect the retainer components (Fig. 50). Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and all pur-

8001094b

Fig. 49 Seal Contact Surface Of Slinger

1 - FRONT SLINGER (PART OF YOKE)

2 - SEAL CONTACT SURFACE MUST BE CLEAN AND SMOOTH

pose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Replace the slinger and seal outright; do not reuse either part.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

ASSEMBLY

Lubricate transfer case components with automatic transmission fluid or petroleum jelly (where indicated) during assembly.

CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

BEARING AND SEAL

(1) Remove snap-ring that retains front output shaft front bearing in case (Fig. 51). Then remove bearing. Use hammer handle, or hammer and brass punch to tap bearing out of case.

(2) Install new front output shaft front bearing with Tool Handle C-4171 and Installer 8033-A with the tapered cone upward (Fig. 52).

DIFFERENTIAL

(1) Lubricate differential components with automatic transmission fluid.

(2) Install sprocket gear in differential bottom case (Fig. 65).

Fig. 65 Installing Differential Sprocket Gear

- 1 - SPROCKET GEAR
- 2 - BOTTOM CASE

(3) Install differential planet gears and new thrust washers (Fig. 66). **Be sure thrust washers are installed at top and bottom of each planet gear.**

(4) Install differential mainshaft gear (Fig. 66).

(5) Align and position differential top case on bottom case (Fig. 67). Align using scribe marks made at disassembly.

(6) While holding differential case halves together, invert the differential and start the differential case bolts.

(7) Tighten differential case bolts to specified torque.

INPUT GEAR/LOW RANGE ASSEMBLY

(1) Assemble low range gear, input gear thrust washers, input gear and input gear retainer (Fig. 68).

(2) Install low range gear snap ring (Fig. 69).

(3) Lubricate input gear and low range gears with automatic transmission fluid.

(4) Start input gear shaft into front case bearing.

(5) Press input gear shaft into front bearing.

(6) Install new input gear snap ring (Fig. 70).

SHIFT FORKS AND MAINSHAFT

(1) Install new sector shaft O-ring and bushing (Fig. 72).

Fig. 72 Sector O-Ring And Bushing Installation

- 1 - SECTOR BUSHING
2 - O-RING

- (2) Install shift sector.
(3) Install new pads on low range fork, if necessary, (Fig. 73).
(4) Assemble low range fork and hub (Fig. 73).
(5) Position low range fork and hub in case. Be sure low range fork pin is engaged in shift sector slot (Fig. 74).
(6) Install first mainshaft bearing spacer on mainshaft (Fig. 75).
(7) Install bearing rollers on mainshaft (Fig. 75).
Coat bearing rollers with generous quantity of petroleum jelly to hold them in place.
(8) Install remaining bearing spacer on mainshaft (Fig. 75). Do not displace any bearings while installing spacer.
(9) Install differential (Fig. 76). **Do not displace mainshaft bearings when installing differential.**
(10) Install differential snap-ring (Fig. 77).
(11) Install intermediate clutch shaft (Fig. 78).

(15) Install mode sleeve in mode fork (Fig. 82). Then install assembled sleeve and fork on mainshaft. Be sure mode sleeve splines are engaged in differential splines.

(16) Install mode fork and mainshaft assembly in case (Fig. 83). Rotate mainshaft slightly to engage shaft with low range gears.

(17) Rotate mode fork pin into shift sector slot.

(18) Install shift rail (Fig. 84). **Be sure rail is seated in both shift forks.**

(19) Rotate shift sector to align lockpin hole in low range fork with access hole in case.

TRANSFER CASE - NV242 (Continued)

J8921-257

Fig. 82 Installing Mode Fork And Sleeve

- 1 - MAINSHAFT
- 2 - SLEEVE
- 3 - MODE FORK ASSEMBLY

(20) Insert an easy-out in range fork lockpin to hold it securely for installation (Fig. 85). **Lockpin is slightly tapered on one end. Insert tapered end into fork and rail.**

(21) Insert lockpin through access hole and into shift fork (Fig. 85). Then remove easy-out and seat the pin with pin punch.

(22) Install plug in lockpin access hole.

(23) Install detent plunger, detent spring and detent plug in case (Fig. 86).

FRONT OUTPUT SHAFT AND DRIVE CHAIN

- (1) Install front output shaft (Fig. 87).
- (2) Install drive chain (Fig. 87). Engage chain with front output shaft sprocket teeth.
- (3) Install drive sprocket (Fig. 87). Engage drive sprocket teeth with chain. Then engage sprocket splines with mainshaft splines.
- (4) Install drive sprocket snap-ring (Fig. 88).

J8921-288

Fig. 90 Installing Case Magnet

- 1 - MAGNET

(3) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front case.

(4) Align and install rear case on front case. Be sure case locating dowels are in place and that main-shaft splines are engaged in oil pump inner gear.

(5) Install and tighten front case-to-rear case bolts to 41 N·m (30 ft. lbs.) torque. **Be sure to install a washer under each bolt used at case dowel locations.**

REAR RETAINER - NV242LD

(1) Remove rear bearing in retainer using Installer 8128 and Handle C-4171.

(2) Install rear bearing in retainer with Tools C-4171 and 5064 (Fig. 91).

800bdfa9

Fig. 92 Rear Bearing Retaining Ring Installation

- 1 - REAR BEARING O.D. RETAINING RING
2 - SNAP-RING PLIERS

(4) Apply bead of Mopar® Sealer P/N 82300234, or Loctite™ Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.

(5) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(6) Install rear bearing I.D. retaining ring and spacer on output shaft.

(7) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

(8) Slide seal onto Seal Protector 6992 (Fig. 93). Slide seal protector and seal onto output shaft.

(9) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 94).

NV242HD REAR RETAINER

(1) Install rear bearing O.D. retaining ring with snap-ring pliers (Fig. 96). Be sure retaining ring is fully seated in retainer groove.

Fig. 96 Rear Bearing Retaining Ring Installation

- 1 - REAR BEARING O.D. RETAINING RING
- 2 - SNAP-RING PLIERS

(2) Apply bead of Mopar® Sealer P/N 82300234, or Loctite® Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.

(3) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(4) Install new output shaft bearing snap-ring (Fig. 97). Lift mainshaft slightly to seat snap-ring in shaft groove, if necessary.

Fig. 97 Install Output Bearing Snap-ring

- 1 - REAR RETAINER
- 2 - SNAP-RING
- 3 - REAR BEARING

(5) Apply 3 mm (1/8 in.) wide bead of Mopar® gas-ket maker or silicone adhesive sealer to mounting surface of extension housing. Allow sealer to set-up slightly before proceeding.

(6) Install extension housing on rear retainer.

(7) Install extension housing bolts and tighten to 35-46 N·m (26-34 ft. lbs.).

COMPANION FLANGE

(1) Lubricate companion flange hub with transmission fluid and install flange on front shaft.

(2) Install new seal washer on front shaft.

(3) Install flange on front shaft and tighten nut to 122-176 N·m (90-130 ft. lbs.).

INSTALLATION

(1) Mount transfer case on a transmission jack.

(2) Secure transfer case to jack with chains.

(3) Position transfer case under vehicle.

(4) Align transfer case and transmission shafts and install transfer case on transmission.

(5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 4).

(6) Align and connect propeller shafts. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(7) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

(8) Install rear crossmember and skid plate, if equipped. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

(9) Remove transmission jack and support stand.

(10) Connect shift rod to transfer case range lever.

(11) Adjust transfer case shift cable.

(12) Lower vehicle and verify transfer case shift operation.

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Remove front output shaft companion flange.
- (4) Remove seal from front case with pry tool (Fig. 98).

Fig. 98 Remove Front Output Shaft Seal

- 1 - OUTPUT SHAFT SEAL
2 - PRYBAR

INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 6952-A as follows:
 - (a) Place new seal on tool. Garter spring on seal goes toward interior of case.
 - (b) Start seal in bore with light taps from hammer (Fig. 99). Once seal is started, continue tapping seal into bore until installer tool seats against case.
- (2) Install companion flange and tighten nut to 122-176 (90-130 ft. lbs.) torque.
- (3) Install front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

REAR RETAINER BUSHING AND SEAL - NV242HD

REMOVAL

- (1) Raise vehicle.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.
- (4) Using Remover 6957, remove bushing from rear retainer (Fig. 100).

Fig. 100 Rear Retainer Bushing Removal

- 1 - REMOVER 6957
2 - REAR RETAINER BUSHING

REAR RETAINER BUSHING AND SEAL - NV242HD (Continued)

INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in retainer.

(3) Using Installer 8160, drive bushing into retainer until installer seats against case (Fig. 101).

(4) Using Installer C-3995-A, install seal in rear retainer (Fig. 102).

80a9b39f

Fig. 101 Rear Retainer Bushing Install

2 - SPECIAL TOOL C-3995-A

(5) Install the rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(6) Verify proper fluid level.

(7) Lower vehicle.

SHIFT CABLE

REMOVAL

(1) Shift transfer case into NEUTRAL.

(2) Raise vehicle.

(3) Disconnect the shift cable eyelet from the transfer case shift lever (Fig. 103).

(4) Remove shift cable from the cable support bracket.

Fig. 103 Transfer Case Shift Cable at Transfer Case

- 1 - TRANSFER CASE SHIFT LEVER
2 - TRANSFER CASE SHIFT CABLE

(5) Lower vehicle.

(6) Remove any necessary console parts for access to shift lever assembly and shift cable.

(7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 104).

(8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 105).

(9) Pull cable through floor panel opening.

(10) Remove transfer case shift cable from vehicle.

INSTALLATION

(1) Route cable through hole in floor pan.

(2) Install seal plate to studs in floor pan.

(3) Install nuts to hold seal plate to floor pan (Fig. 105). Tighten nuts to 7 N·m (65 in.lbs.).

(4) Install the transfer case shift cable to the shifter assembly bracket. Seat cable in bracket and install clip (Fig. 104).

(5) Verify the transfer case shift lever (at console) is in the NEUTRAL position.

(6) Snap the cable onto the shift lever pin (Fig. 104).

SHIFT CABLE (Continued)

**Fig. 104 Transfer Case Shift Cable at Shifter**

- 1 - CLIP
- 2 - SHIFTER
- 3 - TRANSFER CASE SHIFT LEVER PIN
- 4 - TRANSFER CASE SHIFT CABLE

- (7) Raise the vehicle.
- (8) Install the shift cable to the shift cable support bracket and install clip (Fig. 103).
- (9) Verify that the transfer case is still in the NEUTRAL position.

**Fig. 105 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
- 2 - TRANSMISSION SHIFT CABLE
- 3 - TRANSFER CASE SHIFT CABLE

- (10) Snap the shift cable onto the transfer case shift lever (Fig. 103).
- (11) Lower vehicle.
- (12) Verify correct transfer case operation in all ranges.
- (13) Install any console parts removed for access to transfer case shift cable.

TRANSFER CASE - NV247

DESCRIPTION

The NV247 (Fig. 1) is an on-demand 4-wheel drive transfer case with two operating ranges and a neutral position. Operating ranges are 4-high and 4-low. The 4-low range is used for extra pulling power in off-road situations.

Fig. 1 NV247 Transfer Case

TRANSFER CASE IDENTIFICATION

A circular I.D. tag is attached to the rear case of each NV247 transfer case (Fig. 2). The tag indicates the following information:

- Model number
- Serial number
- Assembly number
- Gear ratio
- Location of manufacture

The transfer case serial number also represents the date of build.

Fig. 2 Transfer Case I.D. Tag

- 1 - FILL PLUG
- 2 - I.D. TAG
- 3 - DRAIN PLUG

OPERATION

Under normal driving conditions, the system operates conventionally, and the majority of available torque is applied to the rear wheels. However, when front-to-rear wheel speed variations exist, the progressive differential transfers torque to the axle with the better traction, thus minimizing wheel spin and maximizing control.

The key to this design is a progressive coupling (Fig. 3), which is supplied with pressurized oil by a gerotor style pump. The pump rotor and case are driven by the front and rear driveshafts respectively,

TRANSFER CASE - NV247 (Continued)

and deliver pressurized oil flow to the coupling in proportion to their speed difference. The progressive coupling contains a multi-disc clutch pack that is alternately splined to the front and rear driveshafts, and controls torque variation between the front and rear driveshafts as dictated by the pump.

A set of orifices and valves control the speed-differential starting point and rate of torque transfer rise in the clutch. This allows the system to disregard the normal speed differences between axles that result from variations in front-to-rear loading and typical cornering.

Transfer case operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by an adjustable cable. Range positions are marked on the shifter bezel plate.

80ba7a55

Fig. 3 Progressive Coupling

DIAGNOSIS AND TESTING - TRANSFER CASE - NV247

CONDITION	POSSIBLE CAUSE	CORRECTION
TRANSFER CASE DIFFICULT TO SHIFT OR WILL NOT SHIFT INTO DESIRED RANGE	1. Vehicle speed too great to permit shifting	1. Reduce speed to 3-4 km/h (2-3 mph) before attempting to shift
	2. Transfer case external shift cable binding	2. Lubricate, repair or replace cable, or tighten loose components as necessary
	3. Insufficient or incorrect lubricant	3. Drain and refill to edge of fill hole with correct lubricant
	4. Internal components binding, worn, or damaged	4. Disassemble unit and replace worn or damaged components as necessary
TRANSFER CASE NOISY IN ALL MODES	1. Insufficient or incorrect lubricant	1. Drain and refill to edge of fill hole with correct lubricant. If unit is still noisy after drain and refill, disassembly and inspection may be required to locate source of noise
NOISY IN—OR JUMPS OUT OF 4WD LOW RANGE	1. Transfer case not completely engaged in 4WD LOW (possibly from shift to 4L while rolling)	1. Stop vehicle, shift transfer case to neutral, then shift back to 4WD LOW
	2. Shift linkage loose, binding, or is misadjusted	2. Tighten, lubricate, or repair linkage as necessary. Adjust linkage if necessary
	3. Range fork cracked, inserts worn, or fork is binding on shift rail	3. Disassemble unit and repair as necessary
	4. Annulus gear or lockplate worn or damaged	4. Disassemble unit and repair as necessary
LUBRICANT LEAKING FROM OUTPUT SHAFT SEALS OR FROM VENT	1. Transfer case over filled	1. Drain to correct level
	2. Vent closed or restricted	2. Clear or replace vent if necessary
	3. Output shaft seals damaged or installed correctly	3. Replace seals. Be sure seal lip faces interior of case when installed. Also be sure yoke seal surfaces are not scored or nicked. Remove scores and nicks with fine sandpaper or replace yoke(s) if necessary.

TRANSFER CASE - NV247 (Continued)**REMOVAL**

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove transfer case drain plug and drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember and skid plate, if equipped (Fig. 4).

80ba79c7

Fig. 4 Crossmember Removal

- 1 - CROSSMEMBER
2 - REAR TRANSMISSION MOUNT

- (7) Disconnect front propeller shaft from transfer case at companion flange. Remove rear propeller shaft from vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)

CAUTION: Do not allow propshafts to hang at attached end. Damage to joint can result.

- (8) Disconnect transfer case cable from range lever.
- (9) Disconnect transfer case vent hose (Fig. 5).
- (10) Support transfer case with transmission jack.
- (11) Secure transfer case to jack with chains.

- (12) Remove nuts attaching transfer case to transmission.

- (13) Pull transfer case and jack rearward to disengage transfer case (Fig. 5).

- (14) Remove transfer case from under vehicle.

80ba79c9

Fig. 5 Transfer Case Mounting

- 1 - NV247 TRANSFER CASE

DISASSEMBLY

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

REAR RETAINER AND OIL PUMP

- (1) Remove rear retainer bolts (Fig. 6).
- (2) Remove rear bearing locating ring access plug (Fig. 7).

80ba7a35

Fig. 6 Rear Retainer Bolt Removal

- 1 - REAR RETAINER

TRANSFER CASE - NV247 (Continued)

80ba7a33

Fig. 7 Remove Rubber Access Plug

1 - PLUG

(3) Loosen rear retainer with pry tool to break sealer bead. Pry only against retainer boss as shown (Fig. 8).

(4) Remove rear retainer as follows:

(a) Spread rear bearing locating ring with snap ring pliers (Fig. 9).

(b) Then slide retainer off mainshaft and rear bearing (Fig. 10).

80ba7a34

Fig. 8 Loosening Rear Retainer

1 - RETAINER BOSS
2 - PRY TOOL
3 - SEALER BEAD

2 - PARALLEL JAW SNAP-RING PLIERS

80ba7a37

Fig. 10 Rear Retainer Removal

1 - REAR CASE
2 - REAR RETAINER

TRANSFER CASE - NV247 (Continued)

- (5) Remove rear bearing snap-ring.
- (6) Remove rear bearing. Note position of bearing locating ring groove for assembly reference.
- (7) Disengage oil pickup tube from oil pump and remove oil pump assembly (Fig. 11).
- (8) Remove pick-up tube o-ring from oil pump (Fig. 12), if necessary. Do not disassemble the oil pump, it is not serviceable.

80ba7a38

Fig. 11 Rear Bearing and Oil Pump Removal

- 1 - OIL PUMP
- 2 - TUBE O-RING
- 3 - OIL PICKUP TUBE

80ba7a39

Fig. 12 Pick-up Tube O-ring Location

- 1 - OIL PUMP
- 2 - O-RING

COMPANION FLANGE AND RANGE LEVER

- (1) Remove front companion flange nut as follows:
 - (a) Move range lever to 4L position.
 - (b) Remove nut with socket and impact wrench.
- (2) Remove companion flange. If flange is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller. Be sure puller tool is positioned on flange and not on slinger as slinger will be damaged.
- (3) Remove seal washer from front output shaft. Discard washer as it should not be reused.
- (4) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft.

NOTE: Note position of range lever so it can be re-installed correctly.

REAR CASE

- (1) Support transfer case so rear case is facing upward.
- (2) Remove bolts holding front case to rear case. The case alignment bolt require flat washers (Fig. 13).
- (3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert screwdriver blade only into notches provided at each end of case (Fig. 14).
- (4) Remove rear case (Fig. 15).

J9321-13

Fig. 13 Rear Case Alignment Bolt Locations

- 1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

TRANSFER CASE - NV247 (Continued)

**Fig. 14 Loosening Rear Case**

- 2 - PRY TOOL (IN CASE SLOT)
- 3 - FRONT CASE

**Fig. 15 Rear Case Removal**

- 1 - REAR HOUSING
- 2 - MAINSHAFT
- 3 - TRANSFER CASE

PROGRESSIVE COUPLING

(1) Remove oil pump locating snap-ring and progressive coupling thrust washer from the mainshaft (Fig. 16).

(2) Remove progressive coupling from mainshaft (Fig. 16).

**Fig. 16 Progressive Coupling Removal**

- 1 - SNAP-RING
- 2 - PROGRESSIVE COUPLING

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Remove oil pickup tube from rear case (Fig. 17).

(2) Remove drive gear snap-ring (Fig. 18).

(3) Disengage drive gear (Fig. 18). Pry gear upward and off mainshaft as shown.

(4) Remove front output shaft, drive chain and drive gear as assembly (Fig. 18).

(5) Remove output shaft drive gear snap ring.

(6) Remove output shaft drive gear from output shaft.

**Fig. 17 Oil Pickup Tube Removal**

- 1 - OIL PICKUP TUBE

TRANSFER CASE - NV247 (Continued)

Fig. 18 Front Output Shaft, Drive Gear And Chain Removal

- 1 - REAR HOUSING
- 2 - OUTPUT SHAFT AND SPROCKET
- 3 - MAINSHAFT SPROCKET
- 4 - SNAP-RING
- 5 - DRIVE CHAIN

SHIFT FORKS AND MAINSHAFT

(1) Remove detent plug, O-ring, detent spring and detent plunger (Fig. 19).

Fig. 19 Detent Plug, Spring And Plunger Removal

- 1 - DETENT PLUG
- 2 - DETENT SPRING
- 3 - DETENT PLUNGER
- 4 - PLUG O-RING

(2) Remove shift rail from shift fork and transfer case housing.

(3) Rotate range shift fork until it disengages from shift sector.

(4) Remove mainshaft and shift fork from input gear pilot bearing.

NOTE: Loose needle bearings are used to support the drive sprocket hub on the mainshaft. Do not lift mainshaft by drive sprocket hub or needle bearings will become dislodged.

(5) Wrap rag around mainshaft underneath drive sprocket hub and remove drive sprocket hub from mainshaft. Be sure to retrieve all the drive sprocket hub needle bearings.

(6) Remove snap ring holding clutch sleeve onto mainshaft.

(7) Remove range clutch sleeve, blockout spring, locking clutch, and locking clutch spring from mainshaft (Fig. 20).

Fig. 20 Range Clutch Sleeve, Blockout Spring, Locking Clutch and Spring

- 1 - LOCKING CLUTCH SPRING
- 2 - BLOCKOUT SPRING
- 3 - SNAP-RING
- 4 - RANGE CLUTCH SLEEVE
- 5 - LOCKING CLUTCH
- 6 - DRIVE SPROCKET HUB

TRANSFER CASE - NV247 (Continued)

(8) Remove shift sector. Rotate and tilt sector as needed to remove it (Fig. 21).

(9) Remove shift sector bushing and O-ring (Fig. 22).

Fig. 21 Shift Sector Removal

1 - SHIFT SECTOR

Fig. 22 Sector Bushing And O-Ring Removal

1 - SHIFT SECTOR BUSHING

2 - O-RING

INPUT GEAR/LOW RANGE ASSEMBLY

(1) Turn front case on side so front bearing retainer is accessible.

(2) Remove front bearing retainer bolts (Fig. 23).

(3) Remove front bearing retainer as follows:

(a) Loosen retainer with flat blade screwdriver to break sealer bead. **To avoid damaging case and retainer, position screwdriver blade only in slots provided in retainer (Fig. 24).**

(b) Then remove retainer from case and gear.

Fig. 23 Front Bearing Retainer Bolt Removal

1 - FRONT BEARING RETAINER

Fig. 24 Front Bearing Retainer Removal

1 - FRONT BEARING RETAINER

2 - RETAINER NOTCH

3 - FLAT BLADE SCREWDRIVER

TRANSFER CASE - NV247 (Continued)

(4) Remove snap-ring that retains input gear shaft in front bearing (Fig. 25).

(5) Remove input and low range gear assembly (Fig. 26).

Fig. 25 Input Gear Snap-Ring Removal

1 - INPUT GEAR
2 - SNAP-RING

Fig. 26 Input And Low Range Gear Assembly Removal

1 - INPUT AND LOW RANGE GEAR ASSEMBLY

(6) Remove oil seals from following components:

- front bearing retainer.
- rear retainer.
- case halves.

INPUT AND LOW RANGE GEAR

(1) Remove snap-ring that retains input gear in low range gear (Fig. 27).

(2) Remove retainer (Fig. 28).

(3) Remove front tabbed thrust washer (Fig. 29).

(4) Remove input gear (Fig. 30).

(5) Remove rear tabbed thrust washer from low range gear (Fig. 31).

Fig. 27 Input Gear Snap-Ring Removal

1 - INPUT GEAR SNAP-RING

Fig. 28 Input Gear Retainer

1 - INPUT GEAR
2 - LOW RANGE GEAR
3 - RETAINER

TRANSFER CASE - NV247 (Continued)

**Fig. 29 Front Tabbed Thrust Washer**

1 - FRONT TABBED THRUST WASHER

**Fig. 31 Rear Tabbed Thrust Washer Removal**1 - LOW RANGE GEAR
2 - REAR TABBED THRUST WASHER**Fig. 30 Input Gear Removal**1 - INPUT GEAR
2 - LOW RANGE GEAR**CLEANING**

Clean the transfer case components with parts cleaning solvent. Flush the oil passages in the cases and drivetrain components with solvent. This will help remove dirt and particles from these passages.

Dry the transfer case components with compressed air or allow them to air dry on clean shop towels.

Apply compressed air through all oil passages in the cases and gear components to clear them of any residue.

INSPECTION**MAINSHAFT**

Examine the mainshaft components carefully for evidence of wear or damage.

Replace the thrust washers if worn or damaged.

Replace the mainshaft and sprocket gears if the teeth or gear bores are worn or damaged.

Replace the mainshaft bearings if worn, flat spotted, brinelled, or damaged in any way.

Replace the mainshaft if it is bent, exhibits wear or damage to the bearing surfaces, splines or gear teeth.

INPUT AND LOW RANGE GEARS

Inspect the low range gear pinions and pinion pins. Replace the low range gear if any of the pins or pinions are worn or damaged.

Inspect the thrust washers, retainer, and snap-ring. Replace the snap-ring if bent, or distorted. Replace the thrust washers and retainer if worn, cracked or damaged in any way.

Examine the input gear carefully. Be sure the gear teeth and bearing surfaces are in good condition. Replace the gear if wear or damage is evident.

Check the input gear pilot bearing. Rotate the bearing and check for roughness or noise. Also check bearing position in the bore. The bearing should be recessed approximately 2.5 mm (0.100 in.) below the top edge of the bore. The bearing should not be seated at the bottom of the bore. Replace the bearing if worn, or roughness is evident. Replace both the gear and bearing if the bearing is a loose fit in the bore.

TRANSFER CASE - NV247 (Continued)

GEAR CASE AND RETAINERS

Examine both case halves and retainers carefully. Replace any retainer or case half if wear, cracks, or other damage is evident.

Check condition of the low range annulus gear and the shift rail bushing in the front case (Fig. 32). The low range annulus gear is not a serviceable part. Replace the gear and case as an assembly if the gear is loose, worn, or damaged. The shift rail bushing is a serviceable part and can be replaced if necessary.

Fig. 32 Low Range Annulus Gear Location

- 1 - LOW RANGE ANNULUS GEAR
2 - SHIFT RAIL BUSHING

Check the bushing in the rear retainer. Replace the bushing if worn or scored.

Examine the sealing surfaces of both case halves and retainers. Small burrs, or scratches on these surfaces can be reduced with crocus cloth or a fine tooth file.

Examine condition of the shift rail bushing in the front case. If the bushing is worn or damaged, it can be removed with a blind hole type puller. A replacement bushing can be installed with a suitable size driver. Recess the bushing slightly below the edge of the bore but do not seat it all the into the case.

GEARTRAIN

Inspect the mainshaft splines, gear teeth and bearing surfaces carefully for evidence of wear, or damage. Replace the shaft if necessary. do not attempt to salvage it if damaged.

The shift rail and range fork are an assembly. Replace both parts if either is damaged. However, the nylon pads in the fork can be replaced if worn, or cracked.

Inspect the transfer case snap-rings closely. Do not attempt to salvage a distorted snap-ring by straightening or reshaping it. Replace any snap-ring that is distorted, or worn.

Inspect the low range gear, input gear and the gear thrust washers retainer, and snap-ring. The low range gear is serviced as an assembly only. Replace the gear if the case or pinions are damaged.

During inspection, also make sure the seal surface of the input gear is in good condition. Minor nicks on this surface can be reduced with crocus cloth. However, replace the gear if the seal surface is severely scored or worn.

OIL PUMP AND PROGRESSIVE COUPLING

The oil pump and progressive coupling are not serviceable components. Replace the coupling as an assembly if it is damaged. Replace the oil pump as an assembly if the gear teeth are worn, or if the pump has become damaged.

BEARINGS AND SEALS

The transfer case seals should be replaced during overhaul. Use new seals in the input gear bearing retainer, front case and rear retainer. Also replace the yoke seal washer and the detent plug O-ring.

Check condition of each transfer case bearing. Replace any bearing exhibiting signs of roughness, wear, or damage.

ASSEMBLY

Lubricate transfer case components with Mopar® Transfer Case Lubricant or petroleum jelly (where indicated) during assembly.

CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

BEARINGS AND SEALS

- (1) Remove front output shaft seal from front case with pry tool (Fig. 33).
- (2) Remove snap-ring that retains front output shaft bearing in front case (Fig. 34).
- (3) Using tool 6953, remove bearing from front case (Fig. 35).
- (4) Using tool 6953, install new bearing.
- (5) Install snap-ring to hold bearing into case.
- (6) Install new front output seal in front case with Installer Tool 6952-A as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 36). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

- 3 - SPECIAL TOOL 8148

(9) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from inside the annulus gear opening in the case. (Fig. 40).

(10) Install locating ring on new bearing.

(11) Position case so forward end is facing upward.

(12) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface (Fig. 41).

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 42).

2 - RETAINER PLATE
3 - INPUT GEAR
4 - LOW RANGE GEAR
5 - THRUST WASHERS

INPUT AND LOW RANGE GEAR

(1) Lubricate gears and thrust washers (Fig. 45) with transfer case lubricant.

(2) Install first thrust washer in low range gear (Fig. 45). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

(6) Align and install low range/input gear assembly in front case (Fig. 46). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(7) Install snap-ring to hold input/low range gear into front bearing (Fig. 47).

(8) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(9) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(10) Align cavity in seal retainer with fluid return hole in front of case.

**Fig. 46 Input/Low Range Gear Installation**

- 1 - ANNULUS GEAR
2 - INPUT/LOW RANGE GEAR

TRANSFER CASE - NV247 (Continued)

**Fig. 47 Install Input Gear Snap-Ring**

- 1 - INPUT GEAR
2 - SNAP-RING

CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(11) Install bolts to hold retainer to transfer case (Fig. 48). Tighten to 21 N·m (16 ft. lbs.) of torque.

**Fig. 48 Install Front Bearing Retainer**

- 1 - FRONT BEARING RETAINER

SHIFT FORKS AND MAINSHAFT

- (1) Install new sector shaft O-ring and bushing (Fig. 49).
(2) Install shift sector (Fig. 50).

**Fig. 49 Sector O-Ring And Bushing Installation**

- 1 - SECTOR BUSHING
2 - O-RING

**Fig. 50 Shift Sector Installation**

- 1 - SHIFT SECTOR

TRANSFER CASE - NV247 (Continued)

(3) Install locking clutch spring, locking clutch, blockout spring, and range clutch sleeve, to mainshaft as shown in (Fig. 51). Install snap ring.

80ba7a52

Fig. 51 Range Clutch Sleeve, Blockout Spring, Locking Clutch and Spring

- 2 - BLOCKOUT SPRING
- 3 - SNAP-RING
- 4 - RANGE CLUTCH SLEEVE
- 5 - LOCKING CLUTCH
- 6 - DRIVE SPROCKET HUB

(4) Install drive sprocket hub to mainshaft and manually load the needle bearings.

(5) Install new pads on range fork, if necessary.

(6) Install range shift fork to range clutch sleeve. Install mainshaft/range shift fork assembly into transfer case and input planetary assembly. Rotate fork until it engages with slot in shift sector.

(7) Install shift rail to shift range fork and transfer case housing.

(8) Rotate shift sector to NEUTRAL position.

(9) Install new O-ring on detent plug (Fig. 52).

(10) Lubricate detent plunger with transfer case lubricant or light coat of petroleum jelly.

(11) Install detent plunger, spring and plug (Fig. 52).

(12) Verify that plunger is properly engaged in sector.

FRONT OUTPUT SHAFT AND DRIVE CHAIN

(1) Lubricate front output shaft-sprocket assembly, drive chain and drive sprocket with transfer case lubricant.

(2) Assemble drive chain, drive sprocket and front output shaft (Fig. 53).

J9321-22

Fig. 52 Shift Detent Components

- 1 - DETENT PLUG
- 2 - DETENT SPRING
- 3 - DETENT PLUNGER
- 4 - PLUG O-RING

(3) Start drive sprocket on mainshaft.

(4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 53).

(5) Install drive sprocket snap-ring (Fig. 54).

J9321-72

**Fig. 54 Installing Drive Sprocket Snap-Ring**

- 1 - MAINSHAFT DRIVE SPROCKET
 2 - DRIVE SPROCKET SNAP-RING
 3 - SNAP-RING PLIERS

- (6) Install roller bearings if removed.
 (7) Install progressive coupling (Fig. 55).
 (8) Install the progressive coupling thrust washer over the output shaft and against the coupling.
 (9) Install the oil pump locating snap-ring onto the output shaft.

**Fig. 55 Progressive Coupling Installation**

- 1 - SNAP-RING
 2 - PROGRESSIVE COUPLING

- (10) Install oil pickup tube in rear case. Be sure tube is seated in case notch as shown (Fig. 56).

**Fig. 56 Oil Pickup Tube Installation**

- 1 - CASE NOTCH
 2 - OIL PICKUP TUBE ASSEMBLY
 3 - CASE SLOT

- (11) Install magnet in front case pocket (Fig. 57).

**Fig. 57 Installing Case Magnet**

- 1 - MAGNET

TRANSFER CASE - NV247 (Continued)

(12) Clean sealing flanges of front case and rear case with a wax and grease remover.

(13) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting flange of front case. Work sealer bead around bolt holes as shown (Fig. 58).

Fig. 58 Applying Sealer To Front Case Flange

- 1 - FRONT CASE FLANGE
2 - SEALER BEAD

(14) Align and install rear case on front case (Fig. 59).

Fig. 59 Rear Case Installation

- 1 - REAR CASE
2 - FRONT CASE

(15) Verify that oil pickup tube is still seated in case notch and tube end is pointed toward mainshaft (Fig. 60).

Fig. 60 Checking Position Of Oil Pickup Tube

- 1 - TUBE O-RING
2 - CORRECT PICKUP TUBE POSITION

(16) Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (Fig. 61).

(17) Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

Fig. 61 Alignment Bolt

- 1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

TRANSFER CASE - NV247 (Continued)

COMPANION FLANGE AND RANGE LEVER

(1) Install range lever, washer and locknut on sector shaft (Fig. 62). Tighten locknut to 27-34 N·m (20-25 ft. lbs.) torque.

**Fig. 62 Range Lever Installation - Typical**

- 1 - RANGE LEVER
- 2 - WASHER
- 3 - LOCKNUT

(2) Install new seal washer on front output shaft (Fig. 63).

(3) Lubricate flange hub with transfer case lubricant and install flange on front shaft.

(4) Install new seal washer on front shaft.

(5) Install companion flange and new nut on front output shaft.

(6) Tighten flange nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold flange while tightening yoke nut.

**Fig. 63 Flange Seal Washer Installation**

- 1 - YOKE SEAL WASHER

REAR RETAINER AND OIL PUMP

(1) Install new O-ring on flanged end of oil pickup tube.

(2) Install oil pump (Fig. 64).

(3) Insert oil pickup tube in pump (Fig. 65).

(4) Install rear bearing on mainshaft (Fig. 65). Locating ring groove in bearing goes toward end of mainshaft.

(5) Install rear bearing retaining snap-ring (Fig. 66).

**Fig. 64 Installing Oil Pump**

- 1 - OIL PUMP

TRANSFER CASE - NV247 (Continued)

(6) Install rear bearing locating ring in rear retainer, if ring was removed during overhaul.

(7) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting surface of rear retainer. Allow sealer to set-up slightly before proceeding.

(8) Slide rear retainer onto mainshaft (Fig. 67).

(9) Spread rear bearing locating ring and slide rear retainer into place on rear case (Fig. 68).

(10) Install and tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.).

(11) Install rubber access plug (Fig. 69).

- 1 - PLUG

FINAL ASSEMBLY

(1) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.) torque.

(2) Level transfer case and fill it with Mopar® Transfer Case Lubricant. Correct fill level is to bottom edge of fill plug hole.

(3) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.) torque.

INSTALLATION

(1) Mount transfer case on a transmission jack.

(2) Secure transfer case to jack with chains.

(3) Position transfer case under vehicle.

(4) Align transfer case and transmission shafts and install transfer case on transmission.

(5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 70).

80ba79c9

Fig. 70 Install Transfer Case

- 1 - NV247 TRANSFER CASE

TRANSFER CASE - NV247 (Continued)

(6) Connect front propeller shaft and install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

(7) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

(8) Install rear crossmember (Fig. 71) and skid plate, if equipped. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

(9) Remove transmission jack and support stand.

(10) Verify transfer case is in NEUTRAL. Connect shift cable to transfer case range lever.

(11) Lower vehicle and verify transfer case shift operation.

(12) Adjust the transfer case shift cable, if necessary.

80ba79c7

SPECIAL TOOLS (Continued)

**Installer, Bearign - 8128****Installer, Seal - 7884**

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Remove front output shaft companion shaft.
- (4) Remove seal from front case with pry tool (Fig. 72).

**Fig. 72 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL
- 2 - PRYBAR

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6952-A as follows:

- (a) Place new seal on tool. Garter spring on seal goes toward interior of case.
- (b) Start seal in bore with light taps from hammer (Fig. 73). Once seal is started, continue tapping seal into bore until installer tool seats against case.

**Fig. 73 Front Output Seal Installation**

- 1 - INSTALLER 6952-A
- 2 - TRANSFER CASE

(2) Install companion flange and torque nut to 122-176 N·m (90-130 ft. lbs.).

(3) Install front propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

REAR RETAINER BUSHING AND SEAL

REMOVAL

- (1) Raise vehicle on hoist.
- (2) Remove rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.
- (4) Using Remover 6957, remove bushing from rear retainer (Fig. 74).

Fig. 74 Rear Retainer Bushing Removal

- 1 - REMOVER 6957
- 2 - REAR RETAINER BUSHING

INSTALLATION

- (1) Clean fluid residue from sealing surface and inspect for defects.
- (2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in retainer.
- (3) Using Installer 8145, drive bushing into retainer until installer seats against case (Fig. 75).
- (4) Using Installer C-3995-A, install seal in rear retainer (Fig. 76).

Fig. 75 Rear Retainer Bushing Installation

- 1 - REAR RETAINER BUSHING
- 2 - INSTALLER 8145

Fig. 76 Install Rear Retainer Seal

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL C-3995-A

- (5) Install rear propeller shaft. (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)
- (6) Verify proper fluid level.
- (7) Lower vehicle.

SHIFT CABLE

REMOVAL

- (1) Shift transfer case into NEUTRAL.
- (2) Raise vehicle.
- (3) Disconnect the shift cable eyelet from the transfer case shift lever (Fig. 77).
- (4) Remove shift cable from the cable support bracket.

Fig. 77 Transfer Case Shift Cable at Transfer Case

- 1 - TRANSFER CASE SHIFT LEVER
- 2 - TRANSFER CASE SHIFT CABLE

- (5) Lower vehicle.
- (6) Remove any necessary console parts for access to shift lever assembly and shift cable.
- (7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 78).
- (8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 79).
- (9) Pull cable through floor panel opening.
- (10) Remove transfer case shift cable from vehicle.

INSTALLATION

- (1) Route cable through hole in floor pan.
- (2) Install seal plate to studs in floor pan.
- (3) Install nuts to hold seal plate to floor pan (Fig. 79). Tighten nuts to 7 N·m (65 in.lbs.).
- (4) Install the transfer case shift cable to the shifter assembly bracket. Seat cable in bracket and install clip (Fig. 78).
- (5) Verify the transfer case shift lever (at console) is in the NEUTRAL position.
- (6) Snap the cable onto the shift lever pin (Fig. 78).

Fig. 78 Transfer Case Shift Cable at Shifter

- 1 - CLIP
- 2 - SHIFTER
- 3 - TRANSFER CASE SHIFT LEVER PIN
- 4 - TRANSFER CASE SHIFT CABLE

Fig. 79 Shift Cables at Floor Pan

- 1 - SEAL PLATES
- 2 - TRANSMISSION SHIFT CABLE
- 3 - TRANSFER CASE SHIFT CABLE

- (7) Raise the vehicle.
- (8) Install the shift cable to the shift cable support bracket and install clip (Fig. 77).
- (9) Verify that the transfer case is still in the NEUTRAL position.
- (10) Snap the shift cable onto the transfer case shift lever (Fig. 77).
- (11) Lower vehicle.
- (12) Verify correct transfer case operation in all ranges.
- (13) Install any console parts removed for access to transfer case shift cable.

AUTOMATIC TRANSMISSION - 42RE

DESCRIPTION

The 42RE is a four speed fully automatic transmission (Fig. 1) with an electronic governor. The 42RE is equipped with a lock-up clutch in the torque converter. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch.

The transmission contains a front, rear, and direct clutch which function as the input driving components. They also contain the kickdown (front) and the low/reverse (rear) bands which, along with the over-

running clutch and overdrive clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front, rear, or overdrive planetary gear set, transfer the engine power from the input shaft through to the output shaft.

The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication.

The 42RE transmission is cooled by an integral fluid cooler inside the radiator.

IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan gasket surface (Fig. 2). Refer to this information when ordering replacement parts.

Fig. 2 Transmission Part And Serial Number Location

- 1 - PART NUMBER
2 - BUILD DATE
3 - SERIAL NUMBER

GEAR RATIOS The 42RE gear ratios are:

1st	2.74:1
2nd	1.54:1
3rd	1.00:1
4th	0.69:1
Rev.	2.21:1

OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through fourth gear are obtained by

selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assemblies to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in fourth gear, and in third gear when the O/D switch is OFF, when the vehicle is cruising on a level surface after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

Since the overdrive clutch is applied in fourth gear only and the direct clutch is applied in all ranges except fourth gear, the transmission operation for park, neutral, and first through third gear will be described first. Once these powerflows are described, the third to fourth shift sequence will be described.

PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front-clutch-hub and rear-clutch-retainer stops at the rear-clutch-retainer. Therefore, no power flow to the output shaft occurs because no clutches are applied.

AUTOMATIC TRANSMISSION - 42RE (Continued)

The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

Fig. 3 Park Powerflow

- 5 - PAWL

80a06c8f

NEUTRAL POWERFLOW

With the gear selector in the NEUTRAL position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

REVERSE POWERFLOW

When the gear selector is moved into the REVERSE position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

FIRST GEAR POWERFLOW

When the gearshift lever is moved into the DRIVE position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from PARK or NEUTRAL to DRIVE, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined to the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

SECOND GEAR POWERFLOW

In DRIVE-SECOND (Fig. 7), the same elements are applied as in MANUAL-SECOND. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In DRIVE-SECOND, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2-3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

FOURTH GEAR POWERFLOW

Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged

before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

DIAGNOSIS AND TESTING - PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB® scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform stall test if complaint is based on sluggish acceleration. Or, if abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.

(6) Perform hydraulic pressure test if shift problems were noted during road test.

(7) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates

slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CLUTCH AND BAND APPLICATION CHART

SHIFT LEVER POSITION	TRANSMISSION CLUTCHES AND BANDS					OVERDRIVE CLUTCHES		
	FRONT CLUTCH	FRONT BAND	REAR CLUTCH	REAR BAND	OVER- RUNNING CLUTCH	OVERDRIVE CLUTCH	DIRECT CLUTCH	OVER- RUNNING CLUTCH
Reverse	X			X			X	
Drive - First			X		X		X	X
Drive - Second		X	X				X	X
Drive - Third	X		X				X	X
Drive - Fourth	X		X			X		
Manual Second		X	X		X		X	X
Manual First			X	X	X		X	X

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrunning braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 9).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

AUTOMATIC TRANSMISSION - 42RE (Continued)

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

80b170e6

Fig. 9 Pressure Test Port Locations

- 1 - OVERDRIVE CLUTCH TEST PORT
- 2 - GOVERNOR TEST PORT
- 3 - ACCUMULATOR TEST PORT
- 4 - FRONT SERVO TEST PORT
- 5 - REAR SERVO TEST PORT

Test One - Transmission In Manual Low

NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

- (1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.
- (2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.
- (3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.
- (4) Have helper start and run engine at 1000 rpm.
- (5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two - Transmission In 2 Range

NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

- (1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.
- (2) Have helper start and run engine at 1000 rpm.
- (3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.
- (4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.
- (5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three - Transmission In D Range Third Gear

NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

- (1) Turn OD switch off.
- (2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.
- (3) Move Gauge C-3293-SP over to front servo port for this test.
- (4) Have helper start and run engine at 1600 rpm for this test.
- (5) Move transmission shift lever two detents rearward from full forward position. This is D range.
- (6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:
 - Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
 - Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

AUTOMATIC TRANSMISSION - 42RE (Continued)

Test Four - Transmission In Reverse

NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

- (1) Leave vehicle on hoist and leave gauge C-3292 in place at accumulator port.
- (2) Move 300 psi Gauge C-3293-SP back to rear servo port.
- (3) Have helper start and run engine at 1600 rpm for test.
- (4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.
- (5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.
- (6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

Test Five - Governor Pressure

NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

- (1) Move 100 psi Test Gauge C-3292 to governor pressure port.
- (2) Move transmission shift lever two detents rearward from full forward position. This is D range.
- (3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.
- (4) Note governor pressure:
 - Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

Test Six - Transmission In Overdrive Fourth Gear

NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3293-SP for this test. The test should be performed on the road or on a chassis dyno.

- (1) Remove tachometer; it is not needed for this test.
- (2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.
- (3) Lower vehicle.
- (4) Turn OD switch on.
- (5) Secure test gauge so it can be viewed from drivers seat.
- (6) Start engine and shift into D range.
- (7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.
- (8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.
- (9) Return to shop or move vehicle off chassis dyno.

AUTOMATIC TRANSMISSION - 42RE (Continued)

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 10).

Fig. 10 Air Pressure Test Passages

- 1 - REAR SERVO APPLY
- 2 - FRONT SERVO APPLY
- 3 - PUMP SUCTION
- 4 - FRONT CLUTCH APPLY
- 5 - FRONT SERVO RELEASE
- 6 - LINE PRESSURE TO ACCUMULATOR
- 7 - PUMP PRESSURE
- 8 - TO CONVERTER
- 9 - REAR CLUTCH APPLY
- 10 - FROM CONVERTER
- 11 - TO COOLER

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

AUTOMATIC TRANSMISSION - 42RE (Continued)

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak (Fig. 11). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 11). Pump seal or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

Fig. 11 Converter Housing Leak Paths

- 1 - PUMP SEAL
- 2 - PUMP VENT
- 3 - PUMP BOLT
- 4 - PUMP GASKET
- 5 - CONVERTER HOUSING
- 6 - CONVERTER
- 7 - REAR MAIN SEAL LEAK

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 12).
- (2) Leaks at the converter hub weld (Fig. 12).

Fig. 12 Converter Leak Points - Typical

- 1 - OUTSIDE DIAMETER WELD
- 2 - TORQUE CONVERTER HUB WELD
- 3 - STARTER RING GEAR
- 4 - LUG

CONVERTER HOUSING AREA LEAK CORRECTION

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.
- (4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.
- (5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.
- (6) Loosen kickdown lever pin access plug three turns. Apply Loctite[™] 592, or Permatex[®] No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.
- (7) Adjust front band.
- (8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.
- (9) Install transmission and converter housing dust shield.
- (10) Lower vehicle.

DIAGNOSIS AND TESTING - DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

AUTOMATIC TRANSMISSION - 42RE (Continued)

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for PARK, NEUTRAL, FIRST, SECOND, THIRD,

FOURTH, MANUAL FIRST, MANUAL SECOND, and REVERSE gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Add Fluid
	2. Throttle Linkage Mis-adjusted.	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose.	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken.	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect.	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect.	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Mis-adjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Mis-adjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump).	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Mis-adjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB® scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Mis-adjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB® scan tool and repair as required.
	8. Front Band Mis-adjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Mis-adjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Mis-adjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn.	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Circuit Electrical Fault.	1. Test with DRB® scan tool and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Mis-adjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB® scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB® scan tool.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Mis-adjusted/Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB® scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Mis-adjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Mis-assembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Mis-assembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking.	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Mis-adjusted.	2. Adjust linkage.
	3. Rear Band Mis-adjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Mis-adjusted.	3. Adjust linkage.
	4. Gearshift Linkage Mis-adjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines.	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN MANUAL 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Mis-adjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Mis-adjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB® scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB® scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB® scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Mis-adjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB® scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB® scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB® scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB® scan tool and replace if necessary.
	6. Neutral Sense to PCM Wire Shorted/Cut.	6. Test switch/sensor as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB® scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB® scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Mis-adjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB® scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance.	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Mis-adjusted.	1. Adjust linkage/cable.
	2. Neutral Sense Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Park/Neutral Switch, or Transmission Range Sensor Faulty.	3. Refer to service section for test and replacement procedure.
	4. Park/Neutral Switch, or Transmission Range Sensor Connection Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Mis-adjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

AUTOMATIC TRANSMISSION - 42RE (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose Loose/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Park/Neutral Switch, or Transmission Range Sensor Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

AUTOMATIC TRANSMISSION - 42RE (Continued)

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

If only the overdrive unit requires service, refer to Overdrive Removal for proper procedures.

CAUTION: The transmission and torque converter must be removed as an assembly to avoid component damage. The converter driveplate, pump bushing, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Disconnect fluid cooler lines at transmission.
- (4) Remove starter motor. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
- (5) Disconnect and remove crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL) Retain sensor attaching bolts.

CAUTION: The crankshaft position sensor will be damaged if the transmission is removed, or installed, while the sensor is still bolted to the engine block, or transmission (4.0L only). To avoid damage, be sure to remove the sensor before removing the transmission.

- (6) Remove the bolts holding the bell housing brace to the transmission.
- (7) Remove nut holding the bell housing brace to the engine to transmission bending brace.
- (8) Remove the bell housing brace from the transmission (Fig. 13).
- (9) Remove the bolt holding the torque converter cover to the transmission.

- (10) Remove the torque converter cover from the transmission.

80ba79c3

Fig. 13 Bell Housing Brace and Converter Cover

- 1 - TRANSMISSION
2 - TORQUE CONVERTER COVER
3 - BELLHOUSING BRACE

- (11) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

- (12) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal. On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing.

- (13) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

- (14) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts.

- (15) Disconnect wires from park/neutral position switch and transmission solenoid.

- (16) Disconnect gearshift cable from transmission manual valve lever (Fig. 14).

- (17) Disconnect throttle valve cable from transmission bracket and throttle valve lever (Fig. 15).

- (18) Disconnect transfer case shift cable from the transfer case shift lever (Fig. 16).

- (19) Remove the clip securing the transfer case shift cable into the cable support bracket.

- (20) Disconnect transmission fluid cooler lines at transmission fittings and clips.

- (21) Support rear of engine with safety stand or jack.

- (22) Raise transmission slightly with service jack to relieve load on crossmember and supports.

AUTOMATIC TRANSMISSION - 42RE (Continued)

Fig. 20 Remove Upper Transmission Bending Braces

1 - TRANSMISSION BENDING BRACES

80ba79c8

Fig. 19 Remove NV242 Transfer Case

1 - NV242 TRANSFER CASE

(26) Remove bolts holding the upper transmission bending braces to the torque converter housing and the overdrive unit (Fig. 20).

(27) Remove all remaining converter housing bolts.

(28) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(29) Hold torque converter in place during transmission removal.

(30) Lower transmission and remove assembly from under the vehicle.

(31) To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure input shaft end play as follows (Fig. 21).

(a) Attach Adapter 8266-6 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move the input shaft in and out. Record the maximum travel for assembly reference.

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

(7) Remove filter from valve body (Fig. 22). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

AUTOMATIC TRANSMISSION - 42RE (Continued)

- 1 - OIL FILTER
- 2 - VALVE BODY
- 3 - FILTER SCREWS (2)

(8) Remove park/neutral position switch.
 (9) Remove hex head bolts attaching valve body to transmission case (Fig. 23). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 24).

(11) Remove accumulator piston and inner and outer springs (Fig. 25).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

3 - INNER SPRING

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 26).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 26).

**Fig. 26 Removing Oil Pump And Reaction Shaft Support Assembly**

- 1 - OIL PUMP AND REACTION SHAFT SUPPORT ASSEMBLY
2 - SLIDE HAMMER TOOLS C-3752

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 27).

(19) Remove front band lever (Fig. 28).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

**Fig. 27 Removing Front Band Strut**

- 1 - BAND LEVER
2 - BAND STRUT
3 - FRONT BAND

**Fig. 28 Removing Front Band Lever**

- 1 - FRONT BAND LEVER

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 29).

(23) Lift front clutch off rear clutch (Fig. 30). Set clutch units aside for overhaul.

(24) Remove intermediate shaft thrust washer from front end of shaft or from rear clutch hub (Fig. 31).

AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 33 Front Band Removal**

- 1 - DRIVING SHELL
2 - FRONT BAND

(27) Remove planetary geartrain as assembly (Fig. 34). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap-ring (Fig. 35).

(31) Remove low-reverse drum and reverse band.

(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 36).

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 37).

(34) Remove front servo rod guide snap-ring. Exercise caution when removing snap-ring. Servo bore can be scratched or nicked if care is not exercised.

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 38).

(37) Remove rear servo spring retainer snap-ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

NOTE: To Service the overrunning clutch cam or overdrive piston retainer, refer to the Overrunning Clutch Cam service procedure in this section.

- 2 - ROD GUIDE SNAP-RING

CLEANING

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assem-

J9121-345

Fig. 38 Compressing Rear Servo Spring

- 1 - FRONT SERVO SNAP-RING
- 2 - REAR SERVO SNAP-RING
- 3 - SPECIAL TOOL

bly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Lubricate transmission parts with Mopar® ATF +4, type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde™ to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and

AUTOMATIC TRANSMISSION - 42RE (Continued)

seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use Mopar® Door Ease, or Ru-Glyde™ on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 39). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 40).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap-ring (Fig. 41).

J9121-343

Fig. 39 Rear Servo Components

- 5 - SPRING
- 6 - ROD

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 42). Be sure twin lugs on band are seated against reaction pin.

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

(b) Guide drum through rear band.

AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 41 Compressing Front/Rear Servo Springs**

90be44b7

- 1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP-RING

**Fig. 42 Rear Band Installation**

- 1 - REAR BAND

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 43).

(e) Turn drum back and forth. Drum should rotate freely in clockwise direction and lock in

counterclockwise direction (as viewed from front of case).

**Fig. 43 Installing Low-Reverse Drum**

- 1 - REAR BAND
2 - LOW-REVERSE DRUM

(7) Install snap-ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 44).

(8) Install rear band lever and pivot pin (Fig. 45). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 46).

**Fig. 44 Installing Low-Reverse Drum Retaining Snap-Ring**

- 1 - LOW-REVERSE DRUM
2 - HUB OF OVERDRIVE PISTON RETAINER
3 - LOW-REVERSE DRUM SNAP-RING

AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 47 Installing Intermediate Shaft Thrust Plate**

- 1 - INTERMEDIATE SHAFT HUB
2 - INTERMEDIATE SHAFT THRUST PLATE

**Fig. 46 Installing Planetary Geartrain**

- 1 - PLANETARY GEARTRAIN AND INTERMEDIATE SHAFT ASSEMBLY

(10) Install thrust plate on intermediate shaft hub (Fig. 47). Use petroleum jelly to hold thrust plate in place.

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 48). Also verify that shaft seal rings are installed in sequence shown.

(12) Install rear clutch thrust washer (Fig. 49). Use additional petroleum jelly to hold washer in place if necessary.

**Fig. 48 Input Shaft Seal Ring Location**

- 1 - INPUT SHAFT
2 - TEFLON SEAL RING
3 - PLASTIC SEAL RING
4 - REAR CLUTCH RETAINER

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 50). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 51). Use enough petroleum jelly to hold washer in place. Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub. Note

AUTOMATIC TRANSMISSION - 42RE (Continued)

**Fig. 49 Installing Rear Clutch Thrust Washer**

- 1 - REAR CLUTCH RETAINER
- 2 - REAR CLUTCH THRUST WASHER (FIBER)

thickness of this washer. It is a select fit part and is used to control transmission end play.

**Fig. 50 Assembling Front And Rear Clutch Units**

- 1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED
- 2 - REAR CLUTCH ASSEMBLY

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 52). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

(18) Install front and rear clutch units as assembly (Fig. 53). Align rear clutch with front annulus gear and install assembly in driving shell. Be sure output

**Fig. 51 Installing Intermediate Shaft Thrust Plate**

- 1 - INTERMEDIATE SHAFT THRUST WASHER
- 2 - INPUT SHAFT
- 3 - REAR CLUTCH RETAINER HUB

shaft thrust washer and thrust plate are not displaced during installation.

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

**Fig. 52 Aligning Rear Clutch Disc Lugs**

- 1 - REAR CLUTCH DISCS
- 2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

AUTOMATIC TRANSMISSION - 42RE (Continued)

J9121-124

Fig. 53 Installing Front/Rear Clutch Assemblies

- 1 - INPUT SHAFT
- 2 - FRONT CLUTCH
- 3 - REAR CLUTCH

- (20) Assemble front band strut.
- (21) Install front band adjuster, strut and adjusting screw (Fig. 54).
- (22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

J9121-197

Fig. 54 Front Band Linkage Installation

- 1 - BAND LEVER
- 2 - BAND STRUT
- 3 - FRONT BAND

- (23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that front clutch thrust washer is properly positioned (Fig. 55). Use petroleum jelly to hold thrust washer in place if necessary.

- (24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

- (25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 56).

- (26) Align and install oil pump gasket (Fig. 56).

J9121-194

Fig. 55 Reaction Shaft Support Seal Rings And Front Clutch Thrust Washer

J9121-195

Fig. 56 Installing Pilot Studs And Oil Pump Gasket

- 1 - OIL PUMP GASKET
- 2 - PILOT STUD TOOLS C-3288-B

AUTOMATIC TRANSMISSION - 42RE (Continued)

(27) Install oil pump (Fig. 57). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

Fig. 57 Installing Oil

- 1 - OIL PUMP
- 2 - PILOT STUD TOOL
- 3 - PILOT STUD TOOL

(29) Measure input shaft end play (Fig. 58).

NOTE: If end play is incorrect, transmission is incorrectly assembled, or the intermediate shaft thrust washer is incorrect. The intermediate shaft thrust washer is selective.

- (a) Attach Adapter 8266-6 to Handle 8266-8.
- (b) Attach dial indicator C-3339 to Handle 8266-8.
- (c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-6 to secure it to the input shaft.
- (d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- (e) Move input shaft in and out and record reading. End play should be 0.56 - 2.31 mm (0.022 - 0.091 in.). Adjust as necessary.

(30) Install accumulator piston and inner and outer springs (Fig. 59).

(31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.

(32) Install valve body as follows:

80c070b5

Fig. 58 Checking Input Shaft End Play

- 1 - TOOL 8266-8
- 2 - TOOL 8266-6
- 3 - TOOL C-3339

Fig. 59 Accumulator Piston And Springs

- 1 - GOVERNOR PRESSURE SENSOR
- 2 - VALVE BODY
- 3 - PARK ROD
- 4 - ACCUMULATOR PISTON
- 5 - GOVERNOR PRESSURE SOLENOID

AUTOMATIC TRANSMISSION - 42RE (Continued)

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

(35) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 60). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

Fig. 60 Installing Manual Lever Shaft Seal

1 - 15/16" SOCKET
2 - SEAL

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal during installation.

(2) Lubricate oil pump seal lip with transmission fluid.

(3) Align converter and oil pump.

(4) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(5) Check converter seating with steel scale and straightedge (Fig. 61). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(6) Temporarily secure converter with C-clamp.

Fig. 61 Checking Torque Converter Seating - Typical

1 - SCALE
2 - STRAIGHTEDGE

(7) Position transmission on jack and secure it with chains.

(8) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.

(9) Apply a light coating of Mopar® High Temp grease to the torque converter hub pocket in the rear of the crankshaft

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

AUTOMATIC TRANSMISSION - 42RE (Continued)

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install two bolts to attach converter housing to engine.

(14) Install the upper transmission bending braces to the torque converter housing and the overdrive unit. Tighten the bolts to 41 N·m (30 ft.lbs.).

(15) Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).

(16) Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).

(17) Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).

(18) Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

(19) Remove engine support fixture.

(20) Install crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

(21) Install new plastic retainer grommet on any shift cable that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into cable and to snap grommet onto lever.

(22) Connect gearshift and throttle valve cable to transmission.

(23) Connect wires to park/neutral position switch and transmission solenoid connector. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(24) Install all torque converter-to-driveplate bolts by hand.

(25) Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 31 N·m (270 in. lbs.).

(26) Install converter housing access cover. Tighten bolt to 23 N·m (200 in.lbs.).

(27) Install the bell housing brace to the torque converter cover and the engine to transmission bending brace. Tighten the bolts and nut to 41 N·m (30 ft.lbs.).

(28) Install starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION) and cooler line bracket.

(29) Connect cooler lines to transmission.

(30) Install transmission fill tube. Install new seal on tube before installation.

(31) Install exhaust components.

(32) Install transfer case. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).

(33) Install the transfer case shift cable to the cable support bracket and the transfer case shift lever.

(34) Align and connect propeller shaft(s).

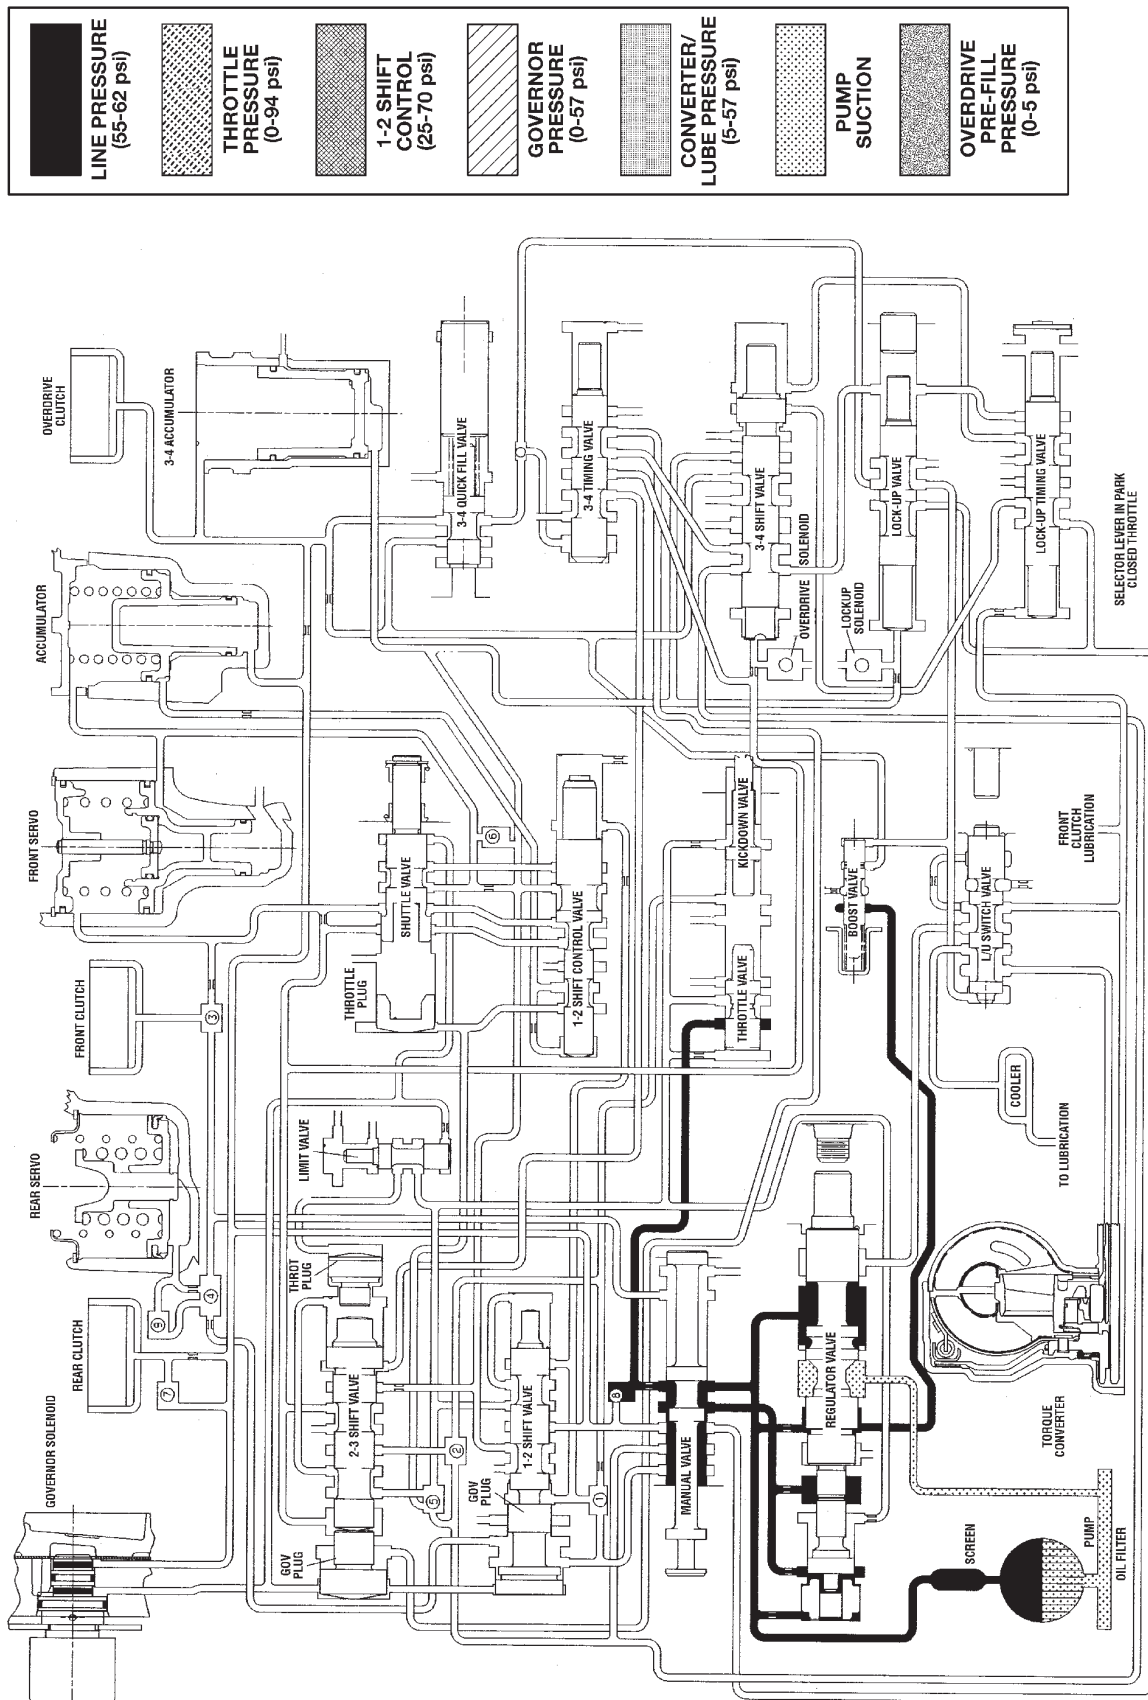

(35) Adjust gearshift linkage and throttle valve cable if necessary.

(36) Lower vehicle.

(37) Fill transmission with Mopar® ATF +4, type 9602, fluid.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 62) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case. The 3-4 accumulator is located in a housing attached to the side of the valve body (Fig. 63).

Fig. 62 Accumulator

- 1 - ACCUMULATOR PISTON
- 2 - PISTON SPRING

Fig. 63 3-4 Accumulator and Housing

- 1 - ACCUMULATOR PISTON
- 2 - 3-4 ACCUMULATOR HOUSING
- 3 - TEFLON SEALS
- 4 - PISTON SPRING
- 5 - COVER PLATE AND SCREWS

OPERATION

Both the accumulator and the 3-4 accumulator function the same. Line pressure is directed to the small end of the piston when the transmission is placed into a DRIVE position (Fig. 64), bottoming it against the accumulator plate. When the 1-2 upshift occurs (Fig. 65), line pressure is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

NOTE: The accumulator is shown in the inverted position for illustrative purposes.

INSPECTION

Inspect the accumulator piston and seal rings (Fig. 66). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 66). Replace the springs if the coils are cracked, distorted or collapsed.

BANDS

DESCRIPTION

KICKDOWN (FRONT) BAND

The kickdown, or "front", band (Fig. 67) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

80a3b192

Fig. 67 Front Band

- 1 - FRONT BAND
- 2 - TRANSMISSION HOUSING

LOW/REVERSE (REAR) BAND

The low/reverse band, or "rear", band (Fig. 68) is similar in appearance and operation to the front band. The rear band is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

OPERATION

KICKDOWN (FRONT) BAND

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

BANDS (Continued)

**Fig. 68 Rear Band**

- 7 - PIVOT PIN

LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

ADJUSTMENT - BANDS**FRONT BAND**

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 69). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx[™] socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 3 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

REAR BAND

The transmission oil pan must be removed for access to the rear band adjusting screw.

**Fig. 69 Front Band Adjustment Screw Location**

- 1 - LOCK-NUT
- 2 - FRONT BAND ADJUSTER

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns (Fig. 70). Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.

**Fig. 70 Rear Band Adjusting Screw Location**

- 1 - ADJUSTING SCREW
- 2 - REAR BAND LEVER
- 3 - LOCKNUT

- (5) Back off adjusting screw 4 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.
- (7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.
- (8) Lower vehicle and refill transmission with Mopar[®] ATF +4, type 9602, fluid.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 71).

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

(1) Verify that the key can only be removed in the PARK position

(2) When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.

(3) Shifting out of PARK should be possible when the ignition key cylinder is in the OFF position.

(4) Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.

(6) Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

(3) With the ignition switch in the "RUN" position depress the BTSI cable locking tab, located on top of the cable connector (Fig. 72) at the steering column and pull the BTSI cable straight out.

(4) Disengage the wire connector at the solenoid on the cable

(5) Remove the transmission shift interlock cable from steering column (Fig. 73).

(6) Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(7) Disconnect the BTSI cable from the shift BTSI lever and remove the cable from the shifter assembly bracket.

(8) Release the BTSI cable from any remaining clips.

(9) Remove BTSI cable from the vehicle.

INSTALLATION

NOTE: The gearshift cable must be secured into position and properly adjusted before the installation of the Brake Transmission Interlock Cable (BTSI).

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

Fig. 73 Brake Transmission Shift Interlock

- 1 - SHIFT MECHANISM
- 2 - SHIFTER BTSI LEVER
- 3 - ADJUSTMENT CLIP

- 4 - STEERING COLUMN ASSEMBLY
- 5 - INTERLOCK CABLE

(1) Push the BTSI cable straight into the square mounting hole in the steering column until cable snaps in place (Fig. 74).

(2) Snap BTSI cable solenoid tie strap into hole in steering column tube.

(3) Engage the wiring connector from brake light switch into BTSI cable solenoid housing.

(4) Route BTSI cable to the shifter mechanism.

(5) Install the BTSI cable end fitting into shifter BTSI lever.

(6) Snap BTSI cable adjuster ears into floor shifter bracket and

(7) Place the ignition key cylinder in the LOCK position.

(8) Push the cable adjuster lock clamp downward to lock it.

(9) Test the BTSI cable operation.

(10) Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

ADJUSTMENT PROCEDURE

(1) Remove floor console as necessary for access to the brake transmission shift interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift the transmission into the PARK position.

(3) Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

80b6b3a0

- 4 - SHIFTER INTERLOCK CABLE CONNECTOR
- 5 - SHIFTER INTERLOCK SOLENOID CONNECTOR
- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

(4) Pull cable lock button up to release cable (Fig. 75).

(5) Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.

(6) Push lock button down until it snaps in place.

BTSI FUNCTION CHECK

(1) Verify removal of ignition key allowed in PARK position only.

(2) When the shift lever is in PARK, and the shift handle push-button is in the out position, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.

(3) Shifting out of PARK should be possible when the ignition key cylinder is in the off position.

(4) Shifting out of PARK should not be possible while applying normal push-button force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.

(6) Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

(7) The floor shifter lever and gate positions should be in alignment with all transmission detent positions.

(8) Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.

(9) With shifter lever handle push-button not depressed and lever detent in:

- PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.

- PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.

- NEUTRAL position- engine start must be possible.

- NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

ELECTRONIC GOVERNOR**DESCRIPTION**

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

ELECTRONIC GOVERNOR (Continued)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 76).

J9321-408A

Fig. 76 Governor Pressure Solenoid Valve

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 77).

80c072af

Fig. 77 Governor Pressure Sensor

- 1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 77).

ELECTRONIC GOVERNOR (Continued)

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, -1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

OPERATION

Compensation is required for performance variations of two of the input devices. Though the slope of the transfer functions is tightly controlled, offset may vary due to various environmental factors or manufacturing tolerances.

The pressure transducer is affected by barometric pressure as well as temperature. Calibration of the zero pressure offset is required to compensate for shifting output due to these factors.

Normal calibration will be performed when sump temperature is above 50 degrees F, or in the absence of sump temperature data, after the first 10 minutes of vehicle operation. Calibration of the pressure transducer offset occurs each time the output shaft speed falls below 200 RPM. Calibration shall be repeated each 3 seconds the output shaft speed is below 200 RPM. A 0.5 second pulse of 95% duty cycle is applied to the governor pressure solenoid valve and the transducer output is read during this pulse. Averaging of the transducer signal is necessary to reject electrical noise.

Under cold conditions (below 50 degrees F sump), the governor pressure solenoid valve response may be too slow to guarantee 0 psi during the 0.5 second calibration pulse. Calibration pulses are continued during this period, however the transducer output values are discarded. Transducer offset must be read at key-on, under conditions which promote a stable reading. This value is retained and becomes the offset during the "cold" period of operation.

GOVERNOR PRESSURE SOLENOID VALVE

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

GOVERNOR PRESSURE SENSOR

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

GOVERNOR PRESSURE CURVES**LOW TRANSMISSION FLUID TEMPERATURE**

When the transmission fluid is cold the conventional governor can delay shifts, resulting in higher than normal shift speeds and harsh shifts. The electronically controlled low temperature governor pressure curve is higher than normal to make the transmission shift at normal speeds and sooner. The PCM uses a temperature sensor in the transmission oil sump to determine when low temperature governor pressure is needed.

NORMAL OPERATION

Normal operation is refined through the increased computing power of the PCM and through access to data on engine operating conditions provided by the PCM that were not available with the previous stand-alone electronic module. This facilitated the development of a load adaptive shift strategy - the ability to alter the shift schedule in response to vehicle load condition. One manifestation of this capability is grade "hunting" prevention - the ability of the transmission logic to delay an upshift on a grade if the engine does not have sufficient power to maintain speed in the higher gear. The 3-2 downshift and the potential for hunting between gears occurs with a heavily loaded vehicle or on steep grades. When hunting occurs, it is very objectionable because shifts are frequent and accompanied by large changes in noise and acceleration.

WIDE OPEN THROTTLE OPERATION

In wide-open throttle (WOT) mode, adaptive memory in the PCM assures that up-shifts occur at the preprogrammed optimum speed. WOT operation is determined from the throttle position sensor, which is also a part of the emission control system. The ini-

ELECTRONIC GOVERNOR (Continued)

tial setting for the WOT upshift is below the optimum engine speed. As WOT shifts are repeated, the PCM learns the time required to complete the shifts by comparing the engine speed when the shifts occur to the optimum speed. After each shift, the PCM adjusts the shift point until the optimum speed is reached. The PCM also considers vehicle loading, grade and engine performance changes due to high altitude in determining when to make WOT shifts. It does this by measuring vehicle and engine acceleration and then factoring in the shift time.

TRANSFER CASE LOW RANGE OPERATION

On four-wheel drive vehicles operating in low range, the engine can accelerate to its peak more rapidly than in Normal range, resulting in delayed shifts and undesirable engine "flare." The low range governor pressure curve is also higher than normal to initiate upshifts sooner. The PCM compares electronic vehicle speed signal used by the speedometer to the transmission output shaft speed signal to determine when the transfer case is in low range.

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove transmission fluid pan and filter.
- (3) Disengage wire connectors from pressure sensor and solenoid (Fig. 78).

Fig. 78 Governor Solenoid And Pressure Sensor

EXTENSION HOUSING BUSHING

REMOVAL

- (1) Remove extension housing yoke seal.
- (2) Insert Remover 6957 into the extension housing. Tighten tool to bushing and remove bushing (Fig. 86).

Fig. 86 Bushing Removal-Typical

- 1 - REMOVER 6957
- 2 - EXTENSION HOUSING BUSHING

INSTALLATION

(1) Align bushing oil hole with oil slot in extension housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 87).

Fig. 87 Extension Housing Seal Installation

- 1 - SPECIAL TOOL C-3995-A OR C-3972-A
- 2 - SPECIAL TOOL C-4471

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Seal Remover C-3985-B (Fig. 88) from overdrive housing.

Fig. 88 Removing Overdrive Housing Yoke Seal

FLUID AND FILTER

DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems have developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

FLUID AND FILTER (Continued)

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.**

The transmission fluid level can be checked two ways.

PROCEDURE ONE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to NEUTRAL.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 90) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF +4, type 9602, to restore correct level. Do not over-fill.

PROCEDURE TWO

(1) Start engine and apply parking brake.

(2) Shift the transmission into DRIVE for approximately 2 seconds.

(3) Shift the transmission into REVERSE for approximately 2 seconds.

(4) Shift the transmission into PARK.

804d8ee

Fig. 90 Dipstick Fluid Level Marks - Typical

1 - DIPSTICK

2 - MAXIMUM CORRECT FLUID LEVEL

3 - ACCEPTABLE FLUID LEVEL

(5) Hook up DRB® scan tool and select engine.

(6) Select sensors.

(7) Read the transmission temperature value.

(8) Compare the fluid temperature value with the figure. (Fig. 91)

(9) Adjust transmission fluid level shown on the dipstick according to the figure.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

(10) Check transmission for leaks.

STANDARD PROCEDURE - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 92).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 93).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

Fig. 91 42/44RE Fluid Fill Graph

Fig. 92 Transmission Pan

- 1 - TRANSMISSION
- 2 - GASKET
- 3 - PAN

Fig. 93 Transmission Filter

- 1 - TRANSMISSION
- 2 - FILTER

FLUID AND FILTER (Continued)

STANDARD PROCEDURES - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4, type 9602, to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF +4 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

FRONT CLUTCH

DESCRIPTION

The front clutch assembly (Fig. 94) is composed of the front clutch retainer, pressure plate, clutch plates, driving discs, piston, piston return spring, return spring retainer, and snap-rings. The front clutch is the forward-most component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack. In some transmissions, the snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

FRONT CLUTCH (Continued)

DISASSEMBLY

(1) Remove waved snap-ring and remove pressure plate, clutch plates and clutch discs (Fig. 95).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 96). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap-ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch retainer piston bore and clutch retainer hub. Discard both seals as they are not reusable.

INSPECTION

Inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 97). The ball must move freely and not stick.

- 2 - COMPRESSOR TOOL C-3575-A
- 3 - RETAINER SNAP-RING
- 4 - SPRING RETAINER

NOTE: Inspect the clutch retainer bushings carefully (Fig. 98). The retainer bushings are **NOT** serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

**Fig. 97 Front Clutch Piston Retainer Check Ball Location**

- 1 - RETAINER CHECK BALL

**Fig. 98 Retainer Bushing Location/Inspection**

- 1 - FRONT CLUTCH RETAINER BUSHINGS (NON-SERVICEABLE)

ASSEMBLY

NOTE: The 42RE transmission uses four plates and discs for the front clutch.

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seals in the clutch retainer lower groove and on outer diameter of the retainer hub. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of the retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate retainer hub, bore and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 99). Use twisting motion to seat piston in bottom of retainer.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.

(5) Position spring in clutch piston (Fig. 100).

(6) Position spring retainer on top of piston spring (Fig. 101). Make sure retainer is properly installed. Small raised tabs should be facing upward. Semicircular lugs on underside of retainer are for positioning retainer in spring.

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 96). Then install new snap-ring to secure spring retainer and spring.

(8) Install clutch plates and discs (Fig. 95). Install steel plate then disc until all plates and discs are installed. The front clutch uses 4 clutch discs and plates in a 42RE transmission.

(9) Install pressure plate and waved snap-ring (Fig. 95).

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates, pressure plates and snap-ring may have to be changed.

FRONT SERVO

DESCRIPTION

The kickdown servo (Fig. 102) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

80a08c99

Fig. 102 Front Servo

- 1 - VENT
2 - PISTON ROD
3 - PISTON
4 - SPRING
5 - RELEASE PRESSURE
6 - APPLY PRESSURE

OPERATION

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend through its guide against the apply lever. Release of the servo at the 2-3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston. The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

FRONT SERVO (Continued)

DISASSEMBLY

- (1) Remove seal ring from rod guide (Fig. 103).
- (2) Remove small snap-ring from servo piston rod. Then remove piston rod, spring and washer from piston.
- (3) Remove and discard servo component O-ring and seal rings.

**Fig. 103 Front Servo**

- 4 - SEAL RING
- 5 - PISTON ROD GUIDE
- 6 - SNAP-RING
- 7 - SERVO SPRING
- 8 - PISTON ROD
- 9 - SERVO PISTON

CLEANING

Clean the servo piston components (Fig. 104) with solvent and dry them with compressed air.

INSPECTION

Inspect the servo components (Fig. 105). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap-ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new O-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

GEARSHIFT CABLE

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

(1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.

(2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.

(3) With floor shift lever handle push-button not depressed and lever in:

(a) PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.

(b) PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position - Normal position. Engine starts must be possible.

(d) NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.

(3) Remove the shift cable eyelet from the transmission manual shift lever (Fig. 107).

(4) Remove shift cable from the cable support bracket.

Fig. 107 Remove Shift Cable From Transmission

- 1 - SHIFT CABLE
- 2 - MANUAL LEVER
- 3 - MANUAL LEVER

(5) Lower vehicle.

(6) Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 108).

(8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 109).

(9) Pull cable through floor panel opening.

Fig. 108 Transmission Shift Cable at Shifter

- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

GEARSHIFT CABLE (Continued)

**Fig. 109 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
2 - TRANSMISSION SHIFT CABLE
3 - TRANSFER CASE SHIFT CABLE

(10) Remove shift cable from vehicle.

INSTALLATION

- (1) Route cable through hole in floor pan.
- (2) Install seal plate to studs in floor pan.
- (3) Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).
- (4) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.
- (5) Place the floor shifter lever in PARK position.
- (6) Loosen the adjustment screw on the shift cable.
- (7) Snap the shift cable onto the shift lever pin.
- (8) Raise the vehicle.
- (9) Install the shift cable to the shift cable support bracket.
- (10) Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
- (11) Snap the shift cable onto the transmission manual shift lever.
- (12) Lower vehicle.
- (13) Verify that the shift lever is in the PARK position.
- (14) Tighten the adjustment screw to 7 N·m (65 in.lbs.).
- (15) Verify correct shifter operation.
- (16) Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position switch or TRS may be faulty.

- (1) Shift transmission into PARK.
- (2) Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (3) Loosen the shift cable adjustment screw (Fig. 110).

**Fig. 110 Shift Cable at the Shifter**

- 1 - SHIFT LEVER PIN
2 - ADJUSTMENT SCREW
3 - SHIFT CABLE
4 - SHIFTER ASSEMBLY BRACKET

- (4) Raise vehicle.
- (5) Unsnap cable eyelet from transmission shift lever (Fig. 111).
- (6) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
- (7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
- (8) Snap cable eyelet onto transmission shift lever.
- (9) Lower vehicle
- (10) Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
- (11) Verify correct operation.
- (12) Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

OIL PUMP

DESCRIPTION

The oil pump (Fig. 112) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear (Fig. 113), a housing, and a cover that also serves as the reaction shaft support.

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

STANDARD PROCEDURES - OIL PUMP
VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil

80a483e7

Fig. 112 Oil Pump and Reaction Shaft Support

- 2 - INNER GEAR
- 3 - OUTER GEAR

cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is inter-

OIL PUMP (Continued)

mittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

DISASSEMBLY

(1) Remove seal ring from housing and reaction shaft support (Fig. 114).

(2) Mark pump housing and support assembly for alignment reference.

(3) Remove bolts attaching pump body to support (Fig. 115).

Fig. 114 Removing Pump Seal Ring

1 - PUMP HOUSING SEAL RING

Fig. 115 Pump Support Bolts

1 - REACTION SHAFT SUPPORT
2 - PUMP

(4) Separate support from pump housing (Fig. 116).

(5) Remove inner and outer gears from reaction shaft support (Fig. 117).

(6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

(7) Remove front clutch thrust washer from support hub (Fig. 118).

OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 119).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 119). Bushing should be flush with pump housing bore.

(3) Stake new pump bushing in two places with blunt punch (Fig. 120). Remove burrs from stake points with knife blade afterward.

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 121). Do not clamp any part of reaction shaft or support in vise.

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

- 7 - PUMP HOUSING

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

**Fig. 120 Staking Oil Pump Bushing**

- 1 - NARROW BLADE
- 2 - BLUNT PUNCH
- 3 - TWO STAKES

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 121).

(6) Slide new bushing onto Installer Tool SP-5325.

(7) Position reaction shaft support upright on a clean smooth surface.

(8) Align bushing in bore. Then tap bushing into place until Bushing Installer SP-5325 bottoms.

(9) Clean reaction shaft support thoroughly after installing bushing.

**Fig. 121 Replacing Reaction Shaft Support Bushing**

- 7 - BUSHING

OIL PUMP (Continued)

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by installing the gears in the pump body and measure pump component clearances as follows:

- (1) Position an appropriate piece of Plastigage[™] across both gears.
- (2) Align the plastigage to a flat area on the reaction shaft housing.
- (3) Install the reaction shaft to the pump housing.
- (4) Separate the reaction shaft housing from the pump housing and measure the Plastigage[™] following the instructions supplied with it.

Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

Clearance between outer gear and pump housing should be 0.10 to 0.19 mm (0.004 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

ASSEMBLY

- (1) Lubricate gear bore in pump housing with transmission fluid.
- (2) Lubricate pump gears with transmission fluid.
- (3) Support pump housing on wood blocks (Fig. 122).
- (4) Install outer gear in pump housing (Fig. 122). Gear can be installed either way (it is not a one-way fit).
- (5) Install pump inner gear (Fig. 123).

CAUTION: The pump inner gear is a one way fit. The bore on one side of the gear inside diameter

(I.D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).

J9321-219

Fig. 122 Supporting Pump And Installing Outer Gear

- 1 - OUTER GEAR
- 2 - PUMP HOUSING
- 3 - WOOD BLOCKS

J9321-465

Fig. 123 Pump Inner Gear Installation

- 1 - OUTER GEAR
- 2 - INNER GEAR

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 124). Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

OIL PUMP (Continued)

**Fig. 124 Hub Seal Ring Position**

- 1 - SEAL RINGS
- 2 - SUPPORT HUB

(8) Install reaction shaft support on pump housing (Fig. 125).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

**Fig. 125 Assembling Reaction Shaft Support And Pump Housing**

- 1 - PUMP HOUSING
- 2 - REACTION SHAFT SUPPORT

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

(a) Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.

(b) Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.

(c) Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).

(d) Remove pump assembly from transmission case.

(12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 126). Be sure seal lip faces inward.

(13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.

(14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

**Fig. 126 Pump Oil Seal Installation**

OUTPUT SHAFT FRONT BEARING

REMOVAL

- (1) Remove overdrive unit from the vehicle.
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft front bearing to overdrive geartrain. (Fig. 127).
- (4) Pull bearing from output shaft.

**Fig. 127 Output Shaft Front Bearing**

- 1 - OUTPUT SHAFT FRONT BEARING
- 2 - SNAP-RING
- 3 - OUTPUT SHAFT
- 4 - GROOVE TO REAR
- 5 - OVERDRIVE GEARTRAIN

OUTPUT SHAFT FRONT BEARING (Continued)

INSTALLATION

- (1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.
- (2) Push bearing onto shaft until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing onto output shaft.
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

OUTPUT SHAFT REAR BEARING

REMOVAL

- (1) Remove overdrive unit from the vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/OVERDRIVE - REMOVAL)
- (2) Remove overdrive geartrain from housing.
- (3) Remove snap-ring holding output shaft rear bearing into overdrive housing (Fig. 128).
- (4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

**Fig. 128 Output Shaft Rear Bearing**

- 1 - OUTPUT SHAFT REAR BEARING
2 - OVERDRIVE HOUSING
3 - SNAP-RING

INSTALLATION

- (1) Place replacement bearing in position in housing.
- (2) Using a suitable driver, drive bearing into housing until the snap-ring groove is visible.
- (3) Install snap-ring to hold bearing into housing (Fig. 128).
- (4) Install overdrive geartrain into housing.
- (5) Install overdrive unit in vehicle.

OVERDRIVE CLUTCH

DESCRIPTION

The overdrive clutch (Fig. 129) is composed of the pressure plate, clutch plates, holding discs, overdrive piston retainer, piston, piston spacer, and snap-rings. The overdrive clutch is the forwardmost component in the transmission overdrive unit and is considered a holding component. The overdrive piston retainer, piston, and piston spacer are located on the rear of the main transmission case.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the piston retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through passages at the lower rear portion of the valve body area. With pressure applied between the piston retainer and piston, the piston moves away from the piston retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the intermediate shaft into the overdrive planetary gear set. The overdrive clutch discs are attached to the overdrive clutch hub while the overdrive clutch plates, reaction plate, and pressure plate are lugged to the overdrive housing. This allows the intermediate shaft to transfer the engine torque to the planetary gear and overrunning clutch. This drives the planetary gear inside the annulus, which is attached to the overdrive clutch drum and output shaft, creating the desired gear ratio. The waved snap-ring is used to cushion the application of the clutch pack.

OVERDRIVE CLUTCH (Continued)

**Fig. 129 Overdrive Clutch**

J9321-369

1 - REACTION PLATE

2 - PRESSURE PLATE

OVERDRIVE OFF SWITCH

DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

OPERATION

At key-on, fourth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow upshifts to fourth gear. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the powertrain control module.

DIAGNOSIS AND TESTING - OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check conti-

nunity of each component when diagnosis indicates this is necessary.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

OVERDRIVE UNIT

REMOVAL

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Remove transfer case, if equipped.
- (4) Mark propeller shaft universal joint(s) and axle pinion yoke, or the companion flange and flange yoke, for alignment reference at installation, if necessary.
- (5) Disconnect and remove the rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL)
- (6) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.
- (7) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.
- (8) Support transmission with transmission jack.
- (9) Remove bolts attaching overdrive unit to transmission (Fig. 130).

OVERDRIVE UNIT (Continued)

CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

Fig. 130 Overdrive Unit Bolts

- 1 - OVERDRIVE UNIT
- 2 - ATTACHING BOLTS (7)

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 131).

(2) Remove overdrive piston thrust bearing (Fig. 132).

Fig. 131 Transmission Speed Sensor Removal

- 1 - SOCKET AND WRENCH
- 2 - SPEED SENSOR
- 3 - O-RING

Fig. 132 Overdrive Piston Thrust Bearing Removal

- 1 - THRUST BEARING
- 2 - OVERDRIVE PISTON
- 3 - THRUST PLATE

OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 133). Retain thrust plate. It is a select fit part and may possibly be reused.

(2) Remove intermediate shaft spacer (Fig. 134). Retain spacer. It is a select fit part and may possibly be reused.

OVERDRIVE UNIT (Continued)

**Fig. 133 Overdrive Piston Thrust Plate Removal**

2 - REAR BEARING
3 - SNAP-RING

DIRECT CLUTCH, HUB AND SPRING

WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(1) Mount geartrain assembly in shop press (Fig. 146).

OVERDRIVE UNIT (Continued)

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 146). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap-ring (Fig. 146).

(4) Remove direct clutch pack snap-ring (Fig. 147).

(5) Remove direct clutch hub retaining ring (Fig. 148).

(6) Release press load slowly and completely (Fig. 149).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 149).

 3 - CLUTCH SPRING PLATE
 4 - SPRING PLATE SNAP-RING
 5 - SUN GEAR

(3) Remove overrunning clutch assembly with expanding type snap-ring pliers (Fig. 152). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

(4) Remove thrust bearing from overrunning clutch hub.

(5) Remove overrunning clutch from hub.

(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 153). Use small center punch or scribe to make alignment marks.

8921-248

GEAR CASE AND PARK LOCK

- (1) Remove locating ring from gear case.
- (2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.
- (3) Remove reaction plug snap-ring and remove reaction plug.
- (4) Remove output shaft seal.

CLEANING

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap-rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

INSPECTION

Check condition of the park lock components and the overdrive case.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

OVERDRIVE UNIT (Continued)

Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap-rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should be clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

ASSEMBLY

GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF +4, type 9602, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 159). Lubricate bushings with petroleum jelly, or transmission fluid.

Fig. 159 Output Shaft Pilot Bushing

- 1 - OUTPUT SHAFT HUB
- 2 - OVERRUNNING CLUTCH HUB BUSHING
- 3 - INTERMEDIATE SHAFT PILOT BUSHING

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap-ring (Fig. 160).

(4) Align and install clutch drum on annulus gear (Fig. 161). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 161).

Fig. 160 Annulus Gear Installation

- 3 - ANNULUS GEAR

Fig. 161 Clutch Drum And Outer Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - OUTER SNAP-RING
- 3 - CLUTCH DRUM

OVERDRIVE UNIT (Continued)

(6) Slide clutch drum forward and install inner retaining ring (Fig. 162).

(7) Install rear bearing and snap-ring on output shaft (Fig. 163). Be sure locating ring groove in bearing is toward rear.

J9321-394

Fig. 162 Clutch Drum Inner Retaining Ring Installation

- 1 - ANNULUS GEAR
- 2 - INNER SNAP-RING
- 3 - CLUTCH DRUM

J9321-370

Fig. 163 Rear Bearing And Snap-Ring Installation

- 1 - REAR BEARING
- 2 - SNAP-RING

(8) Install overrunning clutch on hub (Fig. 164). Note that clutch only fits one-way. Shoulder on clutch should seat in small recess at edge of hub.

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. Bearing fits one-way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.

(10) Install overrunning clutch in output shaft (Fig. 165). Insert snap-ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 166). Be sure planetary pinions are fully seated in annulus gear before proceeding.

J9121-322

- 6 - OVERRUNNING CLUTCH ASSEMBLY SEATED IN OUTPUT SHAFT

OVERDRIVE UNIT (Continued)

**Fig. 166 Planetary Gear Installation**

- 1 - PLANETARY GEAR
- 2 - ANNULUS GEAR

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 167). Slide bearing onto gear and seat it against spring plate as shown. Bearing fits one-way only. If it does not seat squarely against spring plate, remove and reposition bearing.

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 168). Be sure sun gear and thrust bearing are fully seated before proceeding.

**Fig. 167 Planetary Thrust Bearing Installation**

- 1 - SPRING PLATE
- 2 - PLANETARY THRUST BEARING
- 3 - SUN GEAR

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring,

**Fig. 168 Sun Gear Installation**

- 1 - SUN GEAR AND SPRING PLATE ASSEMBLY

hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 169). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 170). Be sure spring is properly seated on spring plate.

**Fig. 169 Alignment Tool Installation**

- 1 - SPECIAL TOOL 6227-2
- 2 - PRESS PLATES
- 3 - ASSEMBLED DRUM AND ANNULUS GEAR

OVERDRIVE UNIT (Continued)

**Fig. 170 Direct Clutch Spring Installation**

- 1 - SPECIAL TOOL 6227-2
 2 - DIRECT CLUTCH SPRING
 3 - CLUTCH HUB
 4 - PRESS PLATES

NOTE: The 42RE transmission has 6 direct clutch discs and 5 clutch plates.

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 171).

(b) Install direct clutch reaction plate on clutch hub first. Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 172).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. Be sure plate is installed with shoulder side facing upward (Fig. 173).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 174). Be sure hub is started on sun gear splines before proceeding.

**Fig. 171 42RE Direct Clutch Pack Components**

- 1 - REACTION PLATE

- 2 - PRESSURE PLATE

OVERDRIVE UNIT (Continued)

Fig. 172 Correct Position Of Direct Clutch Reaction Plate

- 1 - REACTION PLATE COUNTERBORE
- 2 - DIRECT CLUTCH REACTION PLATE (FLUSH WITH END OF HUB)
- 3 - CLUTCH HUB

WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

Fig. 173 Correct Position Of Direct Clutch Pressure Plate

- 1 - DIRECT CLUTCH PRESSURE PLATE
- 2 - CLUTCH PACK
- 3 - BE SURE SHOULDER SIDE OF PLATE FACES UPWARD

Fig. 174 Direct Clutch

- 1 - CLUTCH HUB
- 2 - DIRECT CLUTCH PACK
- 3 - CLUTCH DRUM

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap-ring (Fig. 175). Be very sure snap-ring is fully seated in clutch drum ring groove.

OVERDRIVE UNIT (Continued)

(25) Install clutch hub retaining ring (Fig. 176). Be very sure retaining ring is fully seated in sun gear ring groove.

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

Fig. 175 Direct Clutch Pack Snap-Ring Installation

- 1 - SPECIAL TOOL 6227-1
2 - DIRECT CLUTCH PACK SNAP-RING

Fig. 176 Clutch Hub Retaining Ring Installation

- 1 - SPECIAL TOOL 6227-1
2 - CLUTCH HUB RETAINING RING

GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. Note that plug has locating pin at rear (Fig. 177). Be sure pin is seated in hole in case before installing snap-ring.

(4) Install reaction plug snap-ring (Fig. 178). Compress snap ring only enough for installation; do not distort it.

Fig. 177 Reaction Plug Locating Pin And Snap-Ring

- 1 - REACTION PLUG SNAP-RING (DO NOT OVERCOMPRESS TO INSTALL)
2 - LOCATING PIN
3 - PARK LOCK REACTION PLUG

Fig. 178 Reaction Plug And Snap-Ring Installation

- 1 - REACTION PLUG SNAP-RING
2 - SNAP-RING PLIERS

(5) Install new seal in gear case. On 4x4 gear case, use Tool Handle C-4171 and Installer C-3860-A to seat seal in case. On 4 x 2 gear case, use same Handle C-4171 and Installer C-3995-A to seat seal in case.

OVERDRIVE UNIT (Continued)

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 179).

(7) Support geartrain on Tool 6227-1 (Fig. 180). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 180).

Fig. 179 Correct Rear Bearing Locating Ring Position

- 1 - CASE ACCESS HOLE
2 - TAB ENDS OF LOCATING RING

(9) Expand front bearing locating ring with snap-ring pliers (Fig. 181). Then slide case downward until locating ring locks in bearing groove and release snap-ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 182).

Fig. 181 Seating Locating Ring In Rear Bearing

- 1 - EXPAND BEARING LOCATING RING WITH SNAP-RING PLIERS
2 - ACCESS HOLE

2 - ACCESS COVER SCREWS

OVERDRIVE UNIT (Continued)

OVERDRIVE CLUTCH

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 183).

(2) Install wave spring on top of reaction ring (Fig. 184). Reaction ring and wave ring both fit in same ring groove. Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

NOTE: The 42RE transmission has 3 overdrive clutch discs and 2 plates.

(3) Assemble overdrive clutch pack (Fig. 185).

Fig. 183 Overdrive Clutch Reaction Ring Installation

1 - REACTION RING
2 - CLUTCH HUB

Fig. 184 Overdrive Clutch Wave Spring Installation

1 - WAVE SPRING

(4) Install overdrive clutch reaction plate first.

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 186).

Fig. 185 42RE Overdrive Clutch Components

1 - REACTION PLATE

2 - PRESSURE PLATE

OVERDRIVE UNIT (Continued)

Fig. 186 Overdrive Clutch Pack Retaining Ring Installation

1 - OVERDRIVE CLUTCH PACK RETAINING RING

INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 187). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 187).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 188).

(e) Remove Gauge Alignment Tool 6312.

OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

Fig. 187 Shaft End Play Measurement

1 - SPECIAL TOOL 6312

2 - SPECIAL TOOL 6311

3 - SPECIAL TOOL C-4962

End Play Measurement (Inches)	Spacer Thickness (Inches)
.7336 - .7505	.158 - .159
.7506 - .7675	.175 - .176
.7676 - .7855	.193 - .194
.7856 - .8011	.211 - .212

J9121-341

Fig. 188 Intermediate Shaft End Play Spacer Selection

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 189).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 190).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

OVERDRIVE PISTON

(1) Install new seals on over drive piston.

(2) Stand transmission case upright on bellhousing.

OVERDRIVE UNIT (Continued)

**Fig. 189 Overdrive Piston Thrust Plate Measurement**

- 1 - SPECIAL TOOL 6311
2 - DIRECT CLUTCH HUB THRUST BEARING SEAT
3 - SPECIAL TOOL C-4962

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140
1.7950 - 1.8099	.153 - .155
1.8100 - 1.8249	.168 - .170
1.8250 - 1.8399	.183 - .185
1.8400 - 1.8549	.198 - .200
1.8550 - 1.8699	.213 - .215
1.8700 - 1.8849	.228 - .230
1.8850 - 1.8999	.243 - .245

J9121-342

Fig. 190 Overdrive Piston Thrust Plate Selection

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case (Fig. 131).

INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 191).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

**Fig. 191 Trimming Overdrive Case Gasket**

- 1 - GASKET
2 - SHARP KNIFE

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 192).

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.

OVERDRIVE UNIT (Continued)

Fig. 192 Intermediate Shaft Selective Spacer Location

- 1 - SELECTIVE SPACER
- 2 - SPACER GROOVE
- 3 - INTERMEDIATE SHAFT

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Connect the transmission speed sensor and overdrive wiring connectors.

(14) Install the transfer case, if equipped.

(15) Align and install rear propeller shaft, if necessary. (Refer to 3 - DIFFERENTIAL & DRIVELINE/ PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION)

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

DESCRIPTION

The overrunning clutch (Fig. 193) consists of an inner race, an outer race (or cam), rollers and

springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

80be45f8

Fig. 193 Overrunning Clutch

- 1 - OUTER RACE (CAM)
- 2 - ROLLER
- 3 - SPRING
- 4 - SPRING RETAINER
- 5 - INNER RACE (HUB)

OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

DISASSEMBLY

NOTE: To service the overrunning clutch cam and the overdrive piston retainer, the transmission geartrain and the overdrive unit must be removed from the transmission.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

- (1) Remove the overdrive piston (Fig. 194).
- (2) Remove the overdrive piston retainer bolts.
- (3) Remove overdrive piston retainer.
- (4) Remove case gasket.
- (5) Mark the position of the overrunning clutch cam in the case (Fig. 195).
- (6) Remove the overrunning clutch cam bolts.
- (7) Remove the overrunning clutch cam.

**Fig. 194 Overdrive Piston Removal**

**Fig. 195 Overrunning Clutch Cam Removal**

- 1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE
- 2 - OVERRUNNING CLUTCH ASSEMBLY

CLEANING

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in

solvent. Dry them with compressed air after cleaning.

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

ASSEMBLY

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 196). This hole must align with blank area in clutch cam bolt circle (Fig. 197). Mark hole location on clutch cam and blank area in case with grease pencil, paint stripe, or scribe mark for assembly reference.

(2) Mark location of non-threaded hole in clutch cam and blank area in bolt circle with grease pencil.

(3) Align and install overrunning clutch and cam in case (Fig. 198). Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. Be sure this side of cam faces rearward (toward piston retainer).

**Fig. 196 Location Of Non-Threaded Hole In Clutch Cam**

J9121-346

Fig. 198 Overrunning Clutch Installation

- 1 - ALIGN MARKS IDENTIFYING NON-THREADED HOLE IN CAM AND CASE
2 - OVERRUNNING CLUTCH ASSEMBLY

(4) Verify that non-threaded hole in clutch cam is properly aligned. Check alignment by threading a bolt into each bolt hole. Adjust clutch cam position if necessary.

(5) Install and tighten overrunning clutch cam bolts to 17 N·m (13 ft. lbs.) torque. Note that clutch cam bolts are shorter than piston retainer bolts.

(6) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 199). Also install gasket before overdrive piston retainer. Center hole in gasket is

smaller than retainer and cannot be installed over retainer.

(7) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 200). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

J9121-349

Fig. 199 Installing/Aligning Case Gasket

- 1 - CASE GASKET
2 - BE SURE GOVERNOR TUBE FEED HOLES IN CASE AND GASKET ARE ALIGNED

(8) Install new seals on over drive piston.

(9) Stand transmission case upright on bellhousing.

(10) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(11) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(12) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114-2 and inside Guide Ring 8114-1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

NOTE: Install the remaining transmission components and the overdrive unit.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER (Continued)

PARK/NEUTRAL POSITION SWITCH

DIAGNOSIS AND TESTING - PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

REMOVAL

- (1) Raise vehicle and position drain pan under switch.
- (2) Disconnect switch wires.
- (3) Remove switch from case.

INSTALLATION

- (1) Move shift lever to PARK and NEUTRAL positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 201).

**Fig. 201 Park/Neutral Position Switch**

- 1 - NEUTRAL CONTACT
2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
3 - PARK CONTACT
4 - SWITCH

- (2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.
- (3) Test continuity of new switch with 12V test lamp.
- (4) Connect switch wires and lower vehicle.
- (5) Top off transmission fluid level.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

PISTONS (Continued)

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 202) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

Fig. 202 Force and Pressure Relationship

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 203) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These

include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

80bfe273

Fig. 203 Pressure on a Confined Fluid

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 204), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 204), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

PISTONS (Continued)

PISTON TRAVEL

**Fig. 204 Force Multiplication**

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 205) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

**Fig. 205 Piston Travel**PLANETARY GEARTRAIN/
OUTPUT SHAFT

DESCRIPTION

The planetary gearsets (Fig. 206) are designated as the front, rear, and overdrive planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

**Fig. 206 Planetary Gearset**

- 1 - ANNULUS GEAR
- 2 - SUN GEAR
- 3 - PLANET CARRIER
- 4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.

OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

DISASSEMBLY

- (1) Remove planetary snap-ring (Fig. 207).
- (2) Remove front annulus and planetary assembly from driving shell (Fig. 207).
- (3) Remove snap-ring that retains front planetary gear in annulus gear (Fig. 208).
- (4) Remove tabbed thrust washer and tabbed thrust plate from hub of front annulus (Fig. 209).
- (5) Separate front annulus and planetary gears (Fig. 209).
- (6) Remove front planetary gear front thrust washer from annulus gear hub.
- (7) Separate and remove driving shell, rear planetary and rear annulus from output shaft (Fig. 210).
- (8) Remove front planetary rear thrust washer from driving shell.
- (9) Remove tabbed thrust washers from rear planetary gear.
- (10) Remove lock ring that retains sun gear in driving shell. Then remove sun gear, spacer and thrust plates.

INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Inspect the geartrain spacers, thrust plates, snap-rings, and thrust washers. Replace any of these parts that are worn, distorted or damaged. Do not attempt to reuse these parts.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

The planetary gear thrust washers are different sizes. The large diameter washers go on the front planetary and the smaller washers go on the rear planetary. All the washers have four locating tabs on them. These tabs fit in the holes or slots provided in each planetary gear.

Inspect the output shaft carefully. Pay particular attention to the machined bushing/bearing surfaces on the shaft and the governor valve shaft bore at the shaft rear.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location (especially at the governor valve shaft bore).

The annulus gears can be removed from their supports if necessary. Just remove the snap-rings and separate the two parts when replacement is necessary. In addition, the annulus gear bushings can be replaced if severely worn, or scored. However it is not necessary to replace the bushings if they only exhibit normal wear. Check bushing fit on the output shaft to be sure.

ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap-ring is seated and that shoulder-side of support faces rearward (Fig. 211).

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

(4) Install rear annulus over and onto rear planetary gear (Fig. 211).

Fig. 211 Assembling Rear Annulus And Planetary Gear

- 1 - REAR ANNULUS GEAR
- 2 - TABBED THRUST WASHER
- 3 - REAR PLANETARY

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 212). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 213). Use enough petroleum jelly to hold washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 214).

Fig. 212 Installing Rear Annulus And Planetary On Output Shaft

- 2 - OUTPUT SHAFT

Fig. 213 Installing Rear Planetary Front Thrust Washer

- 1 - FRONT TABBED THRUST WASHER
- 2 - REAR PLANETARY GEAR

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(8) Install thrust plate on sun gear (Fig. 215). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

(9) Hold sun gear in place and install thrust plate over sun gear at rear of driving shell (Fig. 216).

(10) Position wood block on bench and support sun gear on block (Fig. 217). This makes it easier to align and install sun gear lock ring. Keep wood block handy as it will also be used for geartrain end play check.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(11) Align rear thrust plate on driving shell and install sun gear lock ring. Be sure ring is fully seated in sun gear ring groove (Fig. 218).

(12) Install assembled driving shell and sun gear on output shaft (Fig. 219).

(13) Install rear thrust washer on front planetary gear (Fig. 220). Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(14) Install front planetary gear on output shaft and in driving shell (Fig. 221).

(15) Install front thrust washer on front planetary gear. Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(16) Assemble front annulus gear and support, if necessary. Be sure support snap-ring is seated.

(17) Install front annulus on front planetary (Fig. 221).

(18) Position thrust plate on front annulus gear support (Fig. 222). Note that plate has two tabs on it. These tabs fit in notches of annulus hub.

(19) Install thrust washer in front annulus (Fig. 223). Align flat on washer with flat on planetary hub. Also be sure washer tab is facing up.

(20) Install front annulus snap-ring (Fig. 224). Use snap-ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

PLANETARY GEARTRAIN/OUTPUT SHAFT (Continued)

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap-ring (or thrust washers) may have to be replaced. Snap-rings are available in three different thicknesses for adjustment purposes.

REAR CLUTCH

DESCRIPTION

The rear clutch assembly (Fig. 227) is composed of the rear clutch retainer, pressure plate, clutch plates, driving discs, piston, Belleville spring, and snap-rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear

pack. The rear clutch is directly behind the front clutch and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are

Fig. 227 Rear Clutch

REAR CLUTCH (Continued)

lugged to the clutch retainer. The waved snap-ring is used to cushion the application of the clutch pack. In some transmissions, the snap-ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front/rear seal rings.

(3) Remove selective clutch pack snap-ring (Fig. 228).

(4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap-ring and wave spring (Fig. 228).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 229). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

CLEANING

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop

towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

INSPECTION

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary (Fig. 230) (Fig. 231).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer. Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 229).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

(9) Install piston spring in retainer and on top of piston (Fig. 233). Concave side of spring faces downward (toward piston).

(10) Install wave spring in retainer (Fig. 233). Be sure spring is completely seated in retainer groove.

(11) Install bottom pressure plate (Fig. 228). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 228).

(13) Install top pressure plate.

(14) Install selective snap-ring. Be sure snap-ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 234).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 234).

(b) Using two small screw drivers, lift the pressure plate and release it.

REAR SERVO

DESCRIPTION

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

OPERATION

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

DISASSEMBLY

- (1) Remove small snap-ring and remove plug and spring from servo piston (Fig. 236).
- (2) Remove and discard servo piston seal ring.

Fig. 236 Rear Servo Components

- 1 - SNAP-RING
- 2 - PISTON SEAL
- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP-RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

CLEANING

Remove and discard the servo piston seal ring (Fig. 237). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap-rings and use new ones at assembly.

SHIFT MECHANISM**DESCRIPTION**

The gear shift mechanism provides six shift positions which are:

- PARK (P)
- REVERSE (R)
- NEUTRAL (N)

- DRIVE (D)
- Manual SECOND (2)
- Manual LOW (1)

OPERATION

Manual LOW (1) range provides first gear only. Over-run braking is also provided in this range. Manual SECOND (2) range provides first and second gear only.

DRIVE range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position. No upshift to fourth gear will occur if any of the following are true:

- The transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F).
- The shift to third is not yet complete.
- Vehicle speed is too low for the 3-4 shift to occur.
- Battery temperature is below -5° C (23° F).

REMOVAL

(1) Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift transmission into PARK.

(3) Disconnect the transmission shift cable at shift lever and shifter assembly bracket (Fig. 239).

**Fig. 239 Transmission Shift Cable**

2 - SHIFTER ASSEMBLY

(5) Snap the transfer case shift cable onto the transfer case shift lever pin.

(6) Install the brake transmission interlock cable into the shifter assembly bracket and into the shifter BTSI lever. (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)

(7) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.

(8) Place the floor shifter lever in park position.

(9) Loosen the adjustment screw on the shift cable.

(10) Snap the shift cable onto the shift lever pin.

(11) Verify that the shift lever is in the PARK position.

(12) Tighten the adjustment screw to 7 N·m (65 in.lbs.).

(13) Verify correct shifter operation.

(14) Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

SOLENOID

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

SOLENOID (Continued)

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

SPEED SENSOR

DESCRIPTION

The speed sensor (Fig. 243) is located in the over-drive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed.

Fig. 243 Transmission Output Speed Sensor

- 1 - TRANSMISSION OUTPUT SHAFT SPEED SENSOR
2 - SEAL

OPERATION

Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. The vehicle speed sensor also serves as a backup for the transmission speed sensor. Signals from this sensor are shared with the powertrain control module.

THROTTLE VALVE CABLE

DESCRIPTION

Transmission throttle valve cable adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive.

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 244). The cable is attached to an arm mounted on the throttle lever

shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

Fig. 244 Throttle Valve Cable

- 1 - THROTTLE VALVE CABLE
2 - THROTTLE VALVE LEVER
3 - THROTTLE BODY

ADJUSTMENTS - TRANSMISSION THROTTLE VALVE CABLE

A correctly adjusted throttle valve cable (Fig. 245) will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

Fig. 245 Throttle Valve Cable

- 1 - THROTTLE VALVE CABLE
2 - THROTTLE VALVE LEVER
3 - THROTTLE BODY

THROTTLE VALVE CABLE (Continued)

ADJUSTMENT VERIFICATION

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body (Fig. 245) is at curb idle position. Then verify that the transmission throttle lever (Fig. 246) is also at idle (fully forward) position.

80bc4e93

Fig. 246 Throttle Valve Cable at Transmission

- 5 - THROTTLE VALVE CABLE BRACKET RETAINING BOLT
- 6 - ELECTRICAL CONNECTORS
- 7 - TRANSMISSION FLUID LINES

(4) Slide cable off attachment stud on throttle body lever.

(5) Compare position of cable end to attachment stud on throttle body lever:

- Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction (Fig. 247).

- If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

- If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

- If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will

80bce9fb

Fig. 247 Throttle Valve Cable at Throttle Linkage

- 1 - THROTTLE LINKAGE
- 2 - THROTTLE VALVE CABLE LOCKING CLIP
- 3 - THROTTLE VALVE CABLE

be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

ADJUSTMENT PROCEDURE

- (1) Turn ignition switch to OFF position.
- (2) Remove air cleaner if necessary.
- (3) Disconnect cable end from attachment stud.

Carefully slide cable off stud. Do not pry or pull cable off.

(4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.

(5) Insert a small screwdriver under edge of retaining clip and remove retaining clip.

(6) Center cable end on attachment stud to within 1 mm (0.039 in.) (Fig. 247).

NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

THROTTLE VALVE CABLE (Continued)

(7) Install retaining clip onto cable housing.

(8) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 248) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the all transmission fluid cooler(s) and lines.

TORQUE CONVERTER (Continued)

IMPELLER

The impeller (Fig. 249) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TORQUE CONVERTER (Continued)

TURBINE

The turbine (Fig. 250) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 251) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 252). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

**Fig. 251 Stator Components**

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 253) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

TORQUE CONVERTER (Continued)

OPERATION

The converter impeller (Fig. 254) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 255). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-

clockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

80bfe276

- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 256). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

**Fig. 256 Checking Torque Converter Seating - Typical**

- 1 - SCALE
- 2 - STRAIGHTEDGE

TORQUE CONVERTER DRAINBACK VALVE**DESCRIPTION**

The drainback valve is located in the transmission cooler outlet (pressure) line.

OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

STANDARD PROCEDURES - TORQUE CONVERTER DRAINBACK VALVE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that gener-

TORQUE CONVERTER DRAINBACK VALVE (Continued)

ates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

TRANSMISSION TEMPERATURE SENSOR

DESCRIPTION

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor (Fig. 257). The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

OPERATION

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

VALVE BODY

DESCRIPTION

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve

80c072af

Fig. 257 Governor Pressure Sensor

- 1 - GOVERNOR BODY
2 - GOVERNOR PRESSURE SENSOR/TRANSMISSION FLUID TEMPERATURE THERMISTOR

body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 258), (Fig. 259), (Fig. 260), and (Fig. 261):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- 3-4 shift valve
- 3-4 timing valve
- 3-4 quick fill valve
- 3-4 accumulator
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch lock-up valve
- Converter clutch lock-up timing Valve
- Shuttle valve
- Shuttle valve throttle plug
- Boost Valve
- 10 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 262) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the PARK position, fluid recirculates through the regulator and manual valves back to the sump.

80c0713c

Fig. 262 Regulator Valve in PARK Position

VALVE BODY (Continued)

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 263), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position and the transmission's internal condition within a range of 57-94 psi (except in REVERSE) (Fig. 264). The regulated line pressure in REVERSE (Fig. 265) is held at much higher pressures than in the other gear positions: 145-280 psi. The higher pressure for REVERSE is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 266) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

8088018a

Fig. 266 Kickdown Valve-Wide Open Throttle

VALVE BODY (Continued)

KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 267) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 268), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of

the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

80c07143

Fig. 268 Kickdown Limit Valve-High Speeds

VALVE BODY (Continued)

1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 269), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 270).

The governor plug serves a dual purpose:

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically "blocked" into position so no upshift can occur.

The physical blocking of the upshift while in the manual "1" position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land

Fig. 269 1-2 Shift Valve-Before Shift

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle

of the plug, pushing the plug back against the end plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

Fig. 270 1-2 Shift Valve-After Shift

VALVE BODY (Continued)

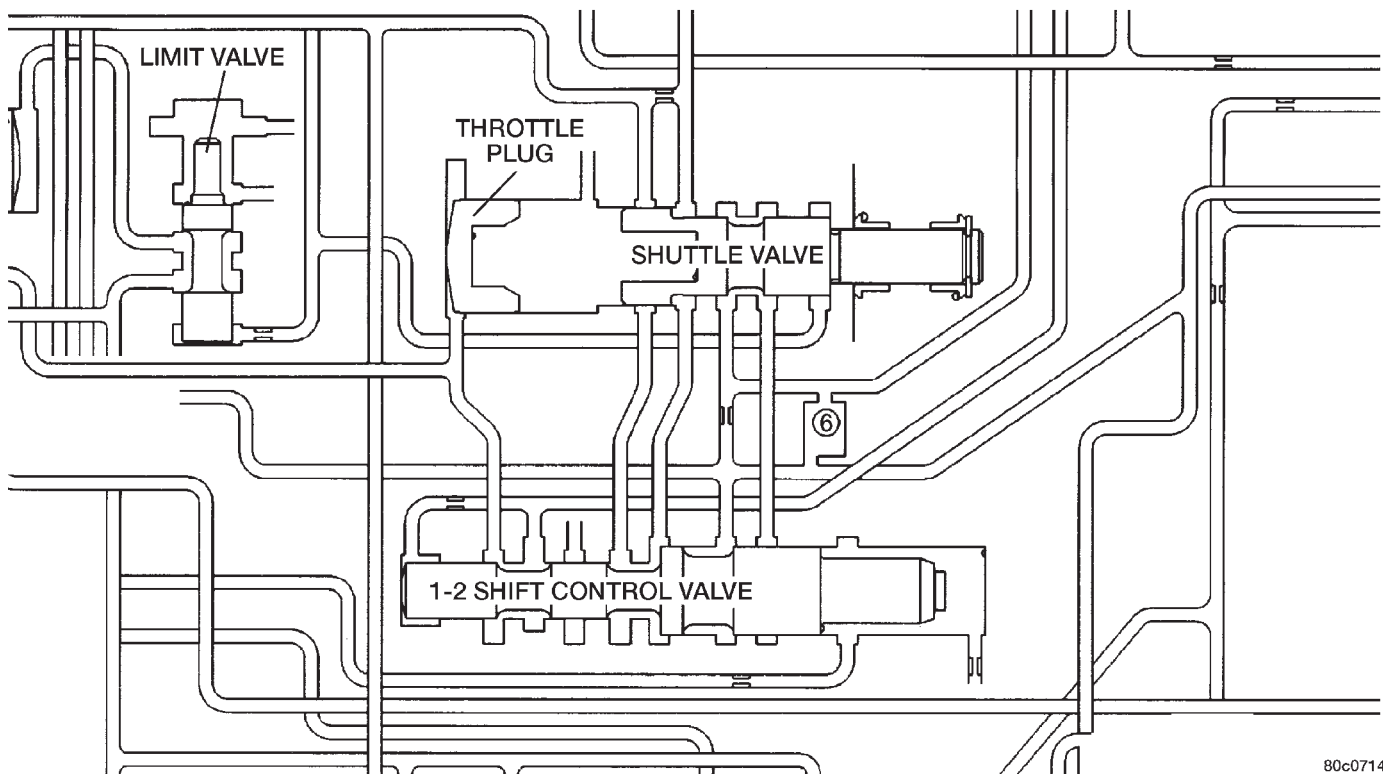

1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a "relay" and "balanced" valve.

The valve has two specific operations (Fig. 271):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the DRIVE position and the transmission is in the first or second gear range, 1-2 shift control or "modulated throttle pressure" is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kick-down servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is "cushioned" and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2 shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

80c07146

Fig. 271 1-2 Shift Control Valve

VALVE BODY (Continued)

2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 272) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the 2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. Since the throttle pressure end of the 2-3 shift valve is larger in diameter than the 1-2 shift valve, the 2-3 shift will always happen at a greater speed than the 1-2 shift. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 273), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo.

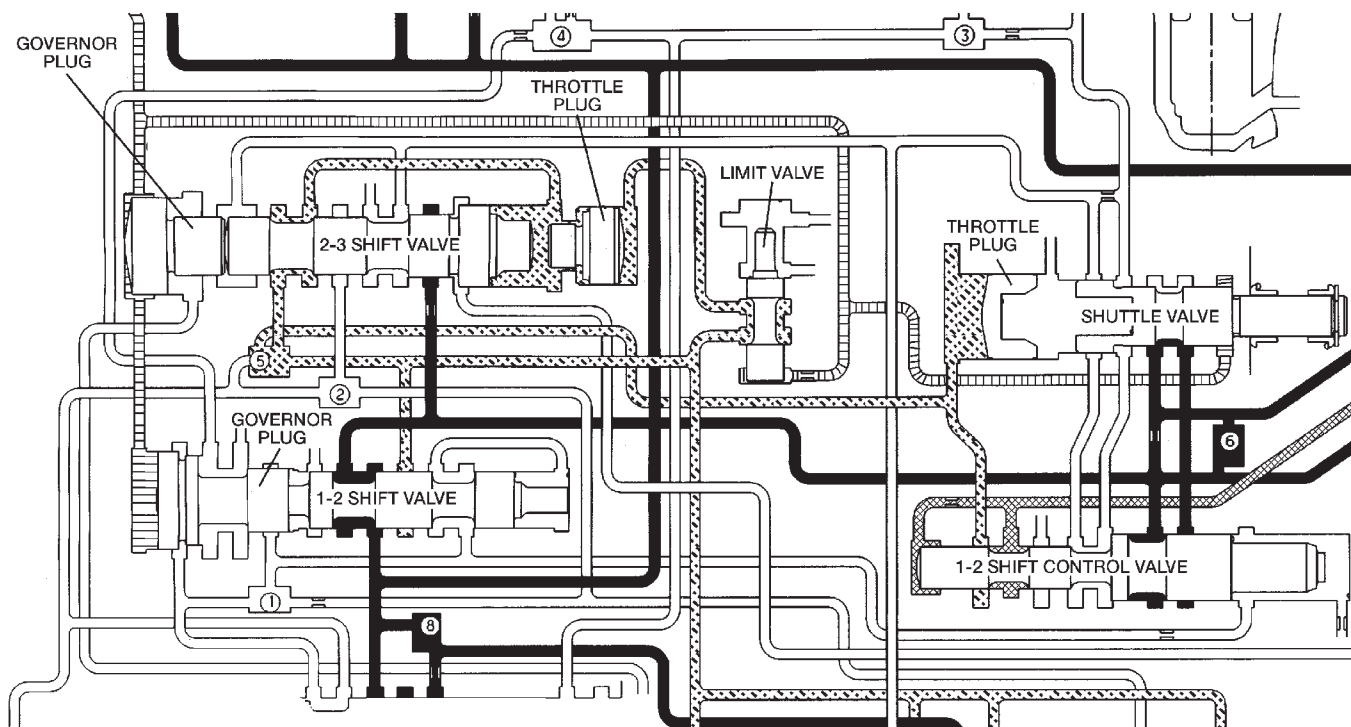

This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

3-4 SHIFT VALVE

The PCM energizes the overdrive solenoid during the 3-4 upshift (Fig. 274). This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position (Fig. 275). This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston.

3-4 TIMING VALVE

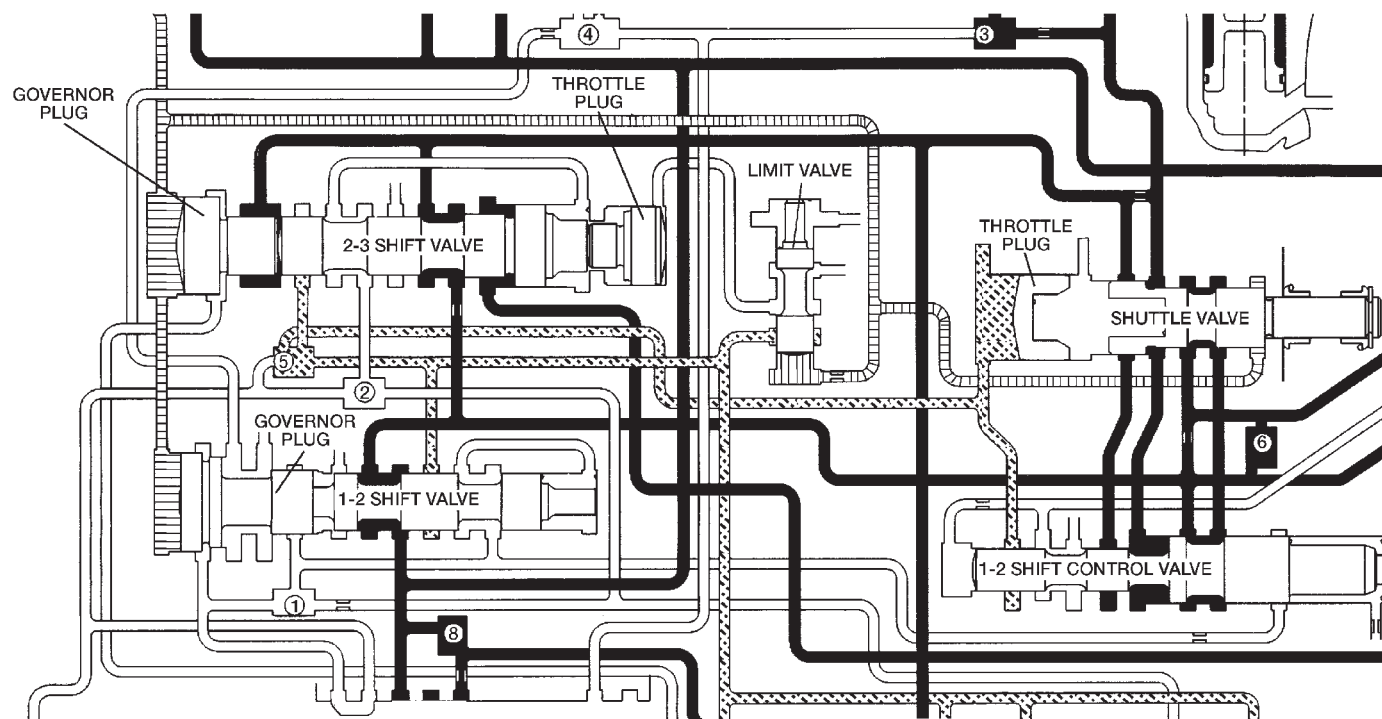

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve (Fig. 275). After the shift, the timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from downshifting before the 3-4 valve (Fig. 274).

Fig. 272 2-3 Shift Valve-Before Shift

VALVE BODY (Continued)

**Fig. 273 2-3 Shift Valve-After Shift****Fig. 274 3-4 Shift Valve Before Shift****Fig. 275 3-4 Shift Valve After Shift**

VALVE BODY (Continued)

3-4 QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift (Fig. 274). This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass (Fig. 275). Clutch fill is then completed through the regular feed orifice.

THROTTLE VALVE

In all gear positions the throttle valve (Fig. 276) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle speed has been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the

80c07149

Fig. 276 Throttle Valve

VALVE BODY (Continued)

1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

SWITCH VALVE

When the transmission is in Drive Second before the TCC application occurs (Fig. 277), the pressure regulator valve is supplying torque converter pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and

back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Fig. 277 Switch Valve-Torque Converter Unlocked

VALVE BODY (Continued)

Once the TCC control valve has moved to the right (Fig. 278), line pressure is directed to the tip of the switch valve, forcing the valve to the right. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to

apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled right allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

8088019a

Fig. 278 Switch Valve-Torque Converter Locked

VALVE BODY (Continued)

MANUAL VALVE

The manual valve (Fig. 279) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve lever.

CONVERTER CLUTCH LOCK-UP VALVE

The torque converter clutch (TCC) lock-up valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC lock-up valve which moves to the right and applies pressure to the torque converter clutch.

CONVERTER CLUTCH LOCK-UP TIMING VALVE

The torque converter clutch (TCC) lock-up timing valve is there to block any 4-3 downshift until the TCC is completely unlocked and the clutch is disengaged.

SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve

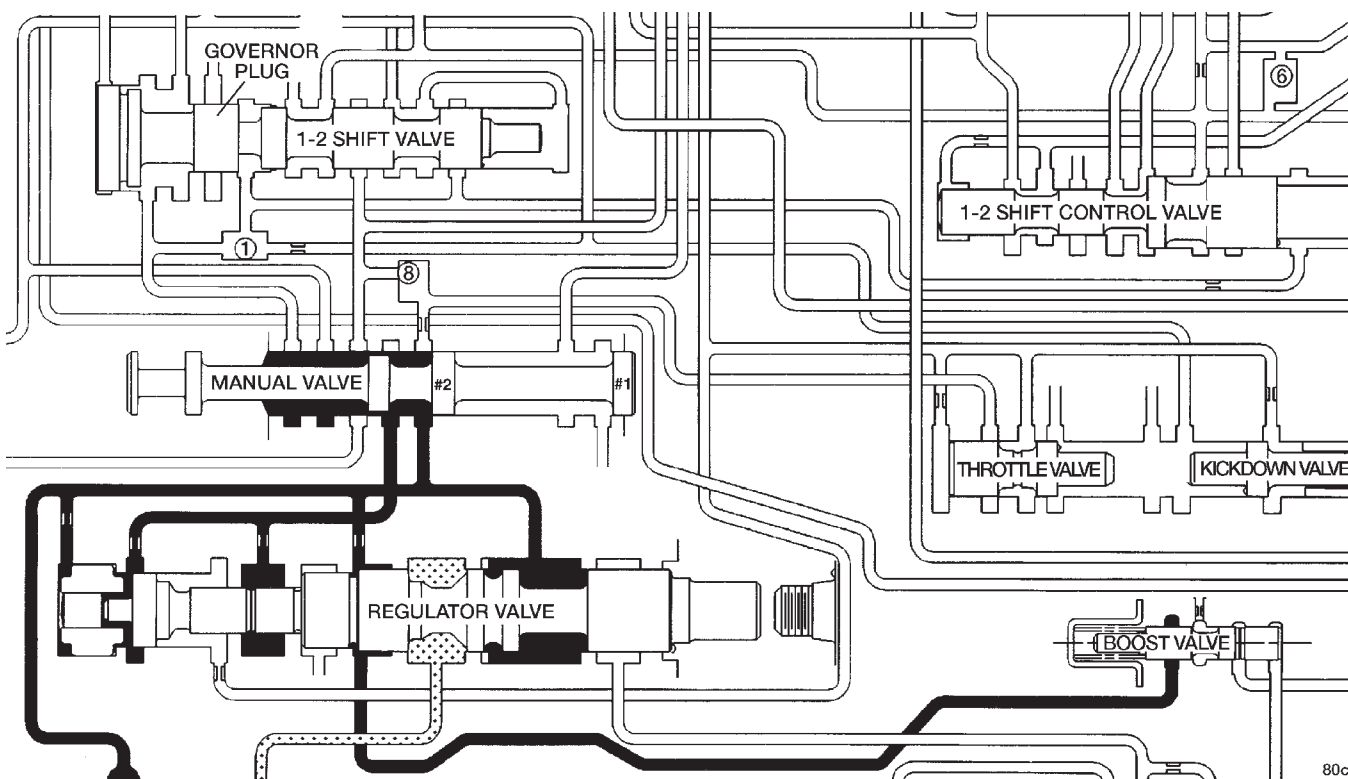

is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 271) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by-pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

BOOST VALVE

The boost valve (Fig. 280) provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts (Fig. 281), and when accelerating in fourth gear. The boost valve also serves to increase line pressure during torque converter lock-up.

REMOVAL

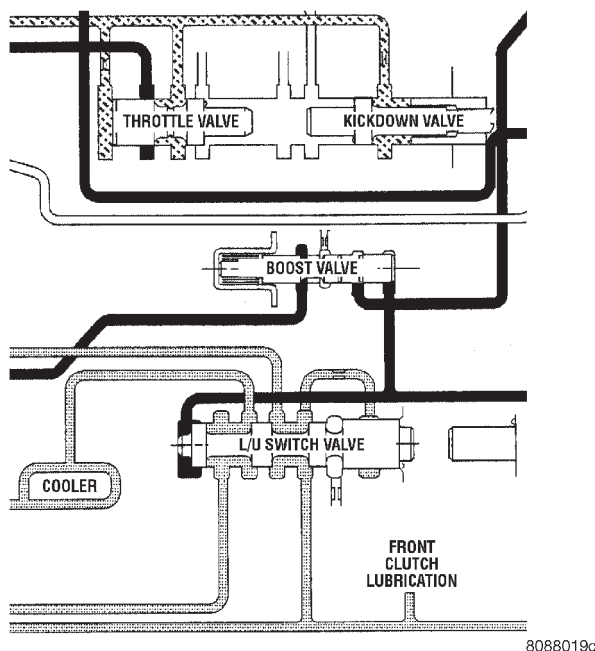

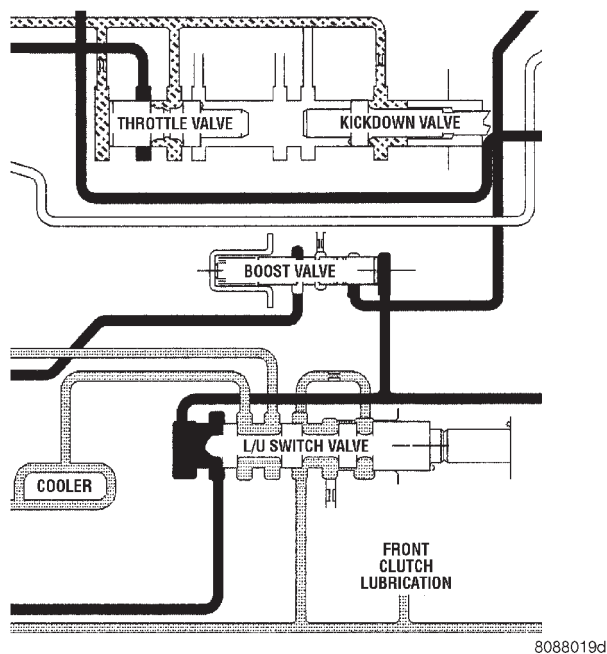

The valve body can be removed for service without having to remove the transmission assembly.

80c0714c

Fig. 279 Manual Valve

VALVE BODY (Continued)

**Fig. 280 Boost Valve Before Lock-up****Fig. 281 Boost Valve After Lock-up**

The valve body can be disassembled for cleaning and inspection of the individual components.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.

- Governor pressure sensor (includes transmission temperature thermistor).

- Converter clutch/overdrive solenoid assembly and harness .

- Governor housing gasket.

- Solenoid case connector O-rings.

- (1) Shift transmission into NEUTRAL.
- (2) Raise vehicle.
- (3) Remove gearshift and throttle levers from shaft of valve body manual lever.

- (4) Disconnect wires at solenoid case connector (Fig. 282).

- (5) Position drain pan under transmission oil pan.

- (6) Remove transmission oil pan and gasket.

- (7) Remove fluid filter from valve body.

- (8) Remove bolts attaching valve body to transmission case.

- (9) Lower valve body enough to remove accumulator piston and springs.

- (10) Work manual lever shaft and electrical connector out of transmission case.

- (11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 283).

**Fig. 282 Transmission Case Connector**

1 - SOLENOID CASE CONNECTOR

2 - PARK/NEUTRAL POSITION SWITCH

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

- (1) Disconnect wires from governor pressure sensor and solenoid.

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either

part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is **NOT** serviceable. Do not try to remove the filter as this will damage the valve housing.

INSPECTION

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer

VALVE BODY (Continued)

plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 312).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 313).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 314).

(2) Install filter screen in upper housing separator plate (Fig. 315).

(3) Align and position upper housing separator plate on transfer plate (Fig. 316).

(4) Install brace plate (Fig. 316). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

J9321-439

Fig. 318 Installing Transfer Plate On Upper Housing

- 1 - FILTER SCREEN
2 - TRANSFER PLATE/SEPARATOR PLATE ASSEMBLY
3 - UPPER HOUSING

UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 317). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 318). Be sure filter screen is seated in proper housing recess.

VALVE BODY (Continued)

(3) Install the ECE check ball into the transfer plate (Fig. 304). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 319).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 320).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 320).

J9321-441

Fig. 319 Lower Housing Separator Plate

- 1 - BE SURE TO ALIGN BORES
- 2 - TRANSFER PLATE
- 3 - LOWER HOUSING (OVERDRIVE) SEPARATOR PLATE

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 321), (Fig. 322) and (Fig. 323) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

J9321-442

Fig. 320 Installing Lower Housing On Transfer Plate And Upper Housing

- 1 - VALVE BODY SCREWS (13)
- 2 - LOWER HOUSING
- 3 - UPPER HOUSING
- 4 - TRANSFER PLATE

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

VALVE BODY (Continued)

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 324).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 324).

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 325).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 325).

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 326).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

VALVE BODY (Continued)

3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 327).

(2) Loosely attach accumulator housing with right-side screw (Fig. 327). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 328). Tighten screws to 4 N·m (35 in. lbs.).

J9321-160

Fig. 327 Converter Clutch And 3-4 Shift Valve Springs

- 1 - RIGHT-SIDE SCREW
- 2 - 3-4 ACCUMULATOR
- 3 - 3-4 SHIFT VALVE SPRING
- 4 - CONVERTER CLUTCH VALVE SPRING

VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 329).

J9521-180

Fig. 328 Seating 3-4 Accumulator On Lower Housing

- 2 - CONVERTER CLUTCH VALVE PLUG

J9521-178

Fig. 329 Detent Ball Spring

- 1 - SPECIAL TOOL 6583 POSITIONED ON DETENT HOUSING

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 330).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

VALVE BODY (Continued)

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Perform Line Pressure and Throttle Pressure adjustments. (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC/VALVE BODY - ADJUSTMENTS)

(18) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(19) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 331). Seat tang in dimple before tightening connector screw.

(20) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(21) Verify that solenoid wire harness is properly routed (Fig. 332). Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.

- 1 - OVERDRIVE/CONVERTER SOLENOID WIRE HARNESS
- 2 - 3-4 ACCUMULATOR COVER PLATE

GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

VALVE BODY (Continued)

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Install fluid filter and pan.

(11) Lower vehicle.

(12) Fill transmission with recommended fluid and road test vehicle to verify repair.

INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 333). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 334).

(3) Check condition of seals on accumulator piston (Fig. 335). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

J9321-389

ADJUSTMENTS - VALVE BODY

CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a

VALVE BODY (Continued)

J9121-230

Fig. 335 Accumulator Piston Components

- 1 - INNER SPRING
- 2 - ACCUMULATOR PISTON
- 3 - OUTER SPRING
- 4 - SEAL RINGS

result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 336).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 337).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head

**Fig. 336 Line Pressure Adjustment**

- 1 - WRENCH
- 2 - 1-5/16 INCH

touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

J9521-109

AUTOMATIC TRANSMISSION - 545RFE

DESCRIPTION

The 545RFE automatic transmission is a sophisticated, multi-range, electronically controlled transmission which combines optimized gear ratios for responsive performance, state of the art efficiency features and low NVH. Other features include driver adaptive shifting and three planetary gear sets to provide wide ratio capability with precise ratio steps for optimum driveability. The three planetary gear sets also make available a unique alternate second gear ratio. The primary 2nd gear ratio fits between 1st and 3rd gears for normal through-gear accelerations. The alternate second gear ratio (2prime) allows smoother 4-2 kickdowns at high speeds to provide 2nd gear passing performance over a wider highway cruising range. An additional overdrive ratio (0.67:1) is also provided for greater fuel economy and less NVH at highway speeds.

The hydraulic portion of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components.

The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Three multiple disc holding clutches
- Five hydraulic accumulators
- Three planetary gear sets
- Dual Stage Hydraulic oil pump
- Valve body
- Solenoid pack

The TCM is the “heart” or “brain” of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

AUTOMATIC TRANSMISSION - 545RFE (Continued)

TRANSMISSION IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan sealing surface (Fig. 1). Refer to this information when ordering replacement parts. A label is attached to the transmission case above the stamped numbers. The label gives additional information which may also be necessary for identification purposes.

Fig. 1 Transmission Part And Serial Number Location

1 - IDENTIFICATION NUMBERS (STAMPED)

GEAR RATIOS The 545RFE gear ratios are:

1st	3.00:1
2nd	1.67:1
2nd Prime	1.50:1
3rd	1.00:1
4th	0.75:1
5th	0.67:1
Reverse	3.00:1

OPERATION

The 545RFE offers full electronic control of all automatic up and downshifts, and features real-time adaptive closed-loop shift and pressure control. Electronic shift and torque converter clutch controls help protect the transmission from damage due to high temperatures, which can occur under severe operating conditions. By altering shift schedules, line pressure, and converter clutch control, these controls reduce heat generation and increase transmission cooling.

To help reduce efficiency-robbing parasitic losses, the transmission includes a dual-stage transmission fluid pump with electronic output pressure control. Under most driving conditions, pump output pressure greatly exceeds that which is needed to keep the clutches applied. The 545RFE pump-pressure control system

monitors input torque and adjusts the pump pressure accordingly. The primary stage of the pump works continuously; the second stage is bypassed when demand is low. The control system also monitors input and output speed and, if incipient clutch slip is observed, the pressure control solenoid duty cycle is varied, increasing pressure in proportion to demand.

A high-travel torque converter damper assembly allows earlier torque converter clutch engagement to reduce slippage. Needle-type thrust bearings reduce internal friction. The 545RFE is packaged in a one-piece die-cast aluminum case. To reduce NVH, the case has high lateral, vertical and torsional stiffness. It is also designed to maximize the benefit of the structural dust cover that connects the bottom of the bell housing to the engine bedplate, enhancing overall power train stiffness. Dual filters protect the pump and other components. A pump return filter is added to the customary main sump filter. Independent lubrication and cooler circuits assure ample pressure for normal transmission operation even if the cooler is obstructed or the fluid cannot flow due to extremely low temperatures.

The hydraulic control system design (without electronic assist) provides the transmission with PARK, REVERSE, NEUTRAL, SECOND, and THIRD gears, based solely on driver shift lever selection. This design allows the vehicle to be driven (in "limp-in" mode) in the event of a electronic control system failure, or a situation that the Transmission Control Module (TCM) recognizes as potentially damaging to the transmission.

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the DRB scan tool.

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION

CAUTION: Before attempting any repair on a 545RFE automatic transmission, check for Diagnostic Trouble Codes with the DRB® scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary. If the

AUTOMATIC TRANSMISSION - 545RFE (Continued)

problem persists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

DIAGNOSIS AND TESTING - PRELIMINARY DIAGNOSIS

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

- (1) Check for transmission fault codes using DRB® scan tool.
- (2) Check fluid level and condition.
- (3) Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform stall test if complaint is based on sluggish acceleration. Or, if abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.
- (6) Perform hydraulic pressure test if shift problems were noted during road test.
- (7) Perform air-pressure test to check clutch operation.

VEHICLE IS DISABLED

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift cable.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

- (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
- (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
- (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

DIAGNOSIS AND TESTING - ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

CLUTCH APPLICATION CHART

SLP	UD	OD	R	2C	4C	L/R	OVERRUNNING
P-PARK						ON	
R-REVERSE			ON			ON	
N-NEUTRAL						ON

1-LOW	ON					ON	ON

*L/R clutch is on only with the output shaft speed below 150 rpm.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

DIAGNOSIS AND TESTING - HYDRAULIC PRESSURE TEST

An accurate tachometer and pressure test gauges are required. Test Gauge C-3293-SP has a 300 psi range and is used at all locations where pressures exceed 100 psi.

Pressure Test Port Locations

Only two pressure ports are supplied on the transmission case. The torque converter clutch apply and release ports are located on the right side of the transmission case (Fig. 2).

80ba79d0

Fig. 2 Torque Converter Pressure Locations

- 1 - TCC RELEASE
- 2 - TO COOLER
- 3 - TCC APPLY
- 4 - FROM COOLER
- 5 - LINE PRESSURE SENSOR

To determine the line pressure, there are two available methods. The DRB® scan tool can be used to read line pressure from the line pressure sensor. The second method is to install Line Pressure Adapter 8259 (Fig. 4) into the transmission case and then install the pressure gauge and the original sensor into the adapter. This will allow a comparison of the DRB® readings and the gauge reading to determine the accuracy of the line pressure sensor. The DRB® line pressure reading should match the gauge reading within ± 10 psi.

In order to access any other pressure tap locations, the transmission oil pan must be removed, the pressure port plugs removed and Valve Body Pressure Tap Adapter 8258-A (Fig. 5) installed. The extensions supplied with Adapter 8258-A will allow the installation of pressure gauges to the valve body. Refer to (Fig. 3) for correct pressure tap location identification.

80ba79d1

Fig. 3 Pressure Tap Locations

80c072fb

Fig. 4 Line Pressure Adapter 8259

- 1 - LINE PRESSURE SENSOR PORT
- 2 - LINE PRESSURE SENSOR
- 3 - TOOL 8259
- 4 - PRESSURE TAP

TEST PROCEDURE

All pressure readings should be taken with the transmission fluid level full, transmission oil at the normal operating temperature, and the engine at 1500 rpm. Check the transmission for proper operation in each gear position that is in question or if a specific element is in question, check the pressure readings in at least two gear positions that employ that element. Refer to the Hydraulic Schematics at the rear of this section to determine the correct pressures for each element in a given gear position.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

80c072fa

Fig. 5 Valve Body Pressure Tap Adapter 8258-A

- 1 - 545RFE TRANSMISSION
2 - TOOL 8258-A

NOTE: The 545RFE utilizes closed loop control of pump line pressure. The pressure readings may therefore vary greatly but should always follow line pressure.

Some common pressures that can be measured to evaluate pump and clutch performance are the upshift/downshift pressures and the garage shift pressures. The upshift/downshift pressure for all shifts except the 4-5 shift is 120 psi. The upshift pressure for the 4-5 shift is 130 psi. The garage shift pressure when performing a N-R shift is 220 psi. The garage shift pressure for the R-N and N-1 shifts is 120 psi.

DIAGNOSIS AND TESTING - AIR CHECKING TRANSMISSION CLUTCH OPERATION

Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The clutch apply passages are shown (Fig. 6).

NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.

Apply air pressure at each port. If the clutch is functioning, a soft thump will be heard as the clutch

80b9a594

Fig. 6 Air Pressure Test Passages

- 1 - LOW REVERSE CLUTCH
2 - 4TH CLUTCH
3 - 2ND CLUTCH
4 - OVERDRIVE CLUTCH
5 - UNDERDRIVE CLUTCH
6 - REVERSE CLUTCH

is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

DIAGNOSIS AND TESTING - CONVERTER HOUSING FLUID LEAK

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Torque converter seal leaks tend to move along the drive hub and onto the rear of the converter. Pump cover seal tend to run down the cover and the inside surface of the bellhousing.

Some leaks, or suspected leaks, may be particularly difficult to locate. If necessary, a Mopar® approved dye may be used to locate a leak.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 7).
- (2) Leaks at the converter hub weld (Fig. 7).

Fig. 7 Torque Converter Assembly

- 2 - STATOR
- 3 - CONVERTER HUB
- 4 - O-RING
- 5 - IMPELLER ASSEMBLY
- 6 - CONVERTER CLUTCH PISTON
- 7 - TURBINE HUB

STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils[™], or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil[™] tap, or equivalent, and installing a Heli-Coil[™] insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil[™], or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

CAUTION: The transmission and torque converter must be removed as an assembly to avoid component damage. The converter driveplate, converter hub o-ring, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

- (1) Disconnect the negative battery cable.

- (2) Raise and support the vehicle
- (3) Mark propeller shaft and axle yokes for assembly alignment.
- (4) Remove the rear propeller shaft
- (5) Remove the front propeller shaft.
- (6) Remove the engine to transmission collar (Fig. 8).

Fig. 8 Transmission Collar

- 1 - ENGINE
- 2 - ENGINE TO TRANSMISSION COLLAR
- 3 - TRANSMISSION

- (7) Remove the exhaust support bracket from the rear of the transmission.

- (8) Disconnect and lower or remove any necessary exhaust components.

- (9) Remove the starter motor.

- (10) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

- (11) Disconnect wires from solenoid and pressure switch assembly, input and output speed sensors, and line pressure sensor.

- (12) Disconnect gearshift cable from transmission manual valve lever (Fig. 9).

- (13) Disconnect transfer case shift cable from the transfer case shift lever (Fig. 10).

- (14) Remove the clip securing the transfer case shift cable into the cable support bracket.

- (15) Disconnect transmission fluid cooler lines at transmission fittings and clips.

- (16) Disconnect the transmission vent hose from the transmission.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

(17) Support rear of engine with safety stand or jack.

(18) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(19) Remove bolts securing rear support and cushion to transmission and crossmember (Fig. 11).

(20) Remove bolts attaching crossmember to frame and remove crossmember.

(21) Remove transfer case (Fig. 12) and (Fig. 13).

(22) Remove all remaining converter housing bolts.

(23) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(24) Hold torque converter in place during transmission removal.

80ba79c7

Fig. 11 Rear Transmission Crossmember

**Fig. 14 Remove Input, Output, and Line Pressure Sensors**

1 - OUTPUT SPEED SENSOR
2 - LINE PRESSURE SENSOR
3 - INPUT SPEED SENSOR

(6) Inspect the ends of the sensors for debris, which may indicate the nature of the transmission failure.

(7) Install Support Stand 8257 onto the transmission case (Fig. 15).

(8) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 16).

**Fig. 15 Install Support Stand - Tool 8257**

1 - TOOL 8257

**Fig. 16 Measure Input Shaft End Play**

1 - TOOL 8266
2 - TOOL C-3339

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and therefore must be recorded and subtracted from the dial indicator reading.

(9) Remove the bolts holding the transmission extension/adapter housing to the transmission case.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

(10) Remove the extension/adaptor housing from the transmission case.

(11) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the output shaft end-play (Fig. 17).

(45) Remove the park pawl rod guide (Fig. 30).

(46) Remove the park pawl pivot shaft, park pawl, and spring (Fig. 30).

(47) Remove the manual selector shaft (Fig. 30).

(48) Remove the manual selector shaft seal.

(49) Remove the dipstick tube seal.

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Type 9602, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

- 1 - GUIDE
- 2 - SNAP-RING
- 3 - SHAFT
- 4 - SPRING
- 5 - PARK PAWL
- 6 - MANUAL SHAFT/LEVER
- 7 - PARK ROD

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

- (1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.
- (2) Install the cooler filter bypass valve.

(3) Torque the bypass valve to specification. The valve uses a tapered pipe thread and excessive torque can damage the transmission case. Tighten the cooler filter bypass valve to 11.3 N·m (100 in.lbs.).

(4) Install a new selector shaft seal using Seal Installer 8253 (Fig. 31).

80c07415

Fig. 31 Install Selector Shaft

- 1 - SEAL
- 2 - TOOL 8253

(5) Install the manual selector shaft and retaining screw. Tighten the manual selector shaft retaining screw to 28 N·m (250 in.lbs.).

(6) Install the park pawl, spring, and shaft (Fig. 32).

(7) Install the park rod and e-clip (Fig. 32).

(8) Install the park rod guide and snap-ring (Fig. 32).

(9) Install a new dipstick tube seal using Seal Installer 8254 (Fig. 33).

NOTE: Before final assembly of transmission centerline, the 2C/4C clutch components should be installed into position and measured as follows:

(10) Install the 2C reaction plate into the transmission case (Fig. 34). The reaction plate is directional. The plate must be installed with the flat side toward the front of the transmission.

(11) Install the 2C clutch pack into the transmission case (Fig. 34).

(12) Install the flat 2C clutch snap-ring into the transmission case (Fig. 34).

- 4 - REACTION PLATE

(13) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area.

(14) Install the 4C retainer/bulkhead tapered snap-ring into the transmission case. Make sure that the open ends of the snap-ring are located in the case opening toward the valve body area.

(15) Using a feeler gauge through the opening in the rear of the transmission case, measure the 2C clutch pack clearance between the 2C reaction plate and the transmission case at four different points. The average of these measurements is the 2C clutch pack clearance. The correct clutch clearance is 0.533-1.27 mm (0.021-0.050 in.). The reaction plate is not selective. If the clutch pack clearance is not within specification, the reaction plate, all the friction discs, and steels must be replaced.

(16) Remove the 4C retainer/bulkhead and all of the 2C clutch components from the transmission case.

(17) Install the low/reverse clutch assembly (Fig. 35). Make sure that the oil feed hole points toward the valve body area and that the bleed orifice is aligned with the notch in the rear of the transmission case.

(18) Install the snap-ring to hold the low/reverse clutch retainer into the transmission case (Fig. 35). The snap-ring is tapered and must be installed with the tapered side forward. Once installed, verify that the snap-ring is fully seated in the snap-ring groove.

(19) Air check the low/reverse clutch and verify correct overrunning clutch operation.

AUTOMATIC TRANSMISSION - 545RFE (Continued)

tional. The plate must be installed with the flat side toward the front of the transmission.

(25) Install the 2C clutch pack into the transmission case (Fig. 39).

(26) Install the number 8 bearing inside the reaction carrier with the round side against the planetary carrier.

(27) Install the reaction planetary gear set and the number 9 bearing into the transmission case (Fig. 40).

AUTOMATIC TRANSMISSION - 545RFE (Continued)

80c07359

Fig. 39 Install 2C Clutch Pack

- 1 - SNAP-RING
- 2 - PLATE
- 3 - DISC
- 4 - REACTION PLATE

(28) Install the flat 2C clutch snap-ring into the transmission case (Fig. 39).

(29) Install the reaction sun gear into the reaction planetary gear set. **Make sure** the small shoulder is facing the front of the transmission (Fig. 40).

(30) Install the number 7 bearing onto the reaction sun gear with the flat side against the sun gear (Fig. 40).

(31) Install the output shaft selective thrust plate onto the reaction annulus with the oil grooves facing the annulus gear and the tabs and notches aligned as shown in (Fig. 41).

(32) Install the number 6 bearing against the output shaft selective spacer with the flat side against the spacer (Fig. 40).

(33) Install the reaction annulus into the reaction planetary gear set (Fig. 40).

(34) Install the 4C retainer/bulkhead into the transmission case. Make sure that the oil feed holes are pointing toward the valve body area. Rotate the

(36) Air check the 2C and 4C clutch operation.

(37) Using Alignment Plate 8261, Adapter 8266-17 from End-Play Tool Set 8266 and Dial Indicator

C-3339, measure and record the output shaft end-play (Fig. 43). The correct output shaft end-play is 0.22-0.55 mm (0.009-0.021 in.). Adjust as necessary. Install the chosen output shaft selective spacer and re-measure end-play to verify selection.

80c07353

Fig. 43 Measure Output Shaft End Play

- 1 - TOOL 8261
- 2 - TOOL 8266
- 3 - TOOL C-3339

(38) Apply a bead of RTV silicone and install the extension/adaptor housing onto the transmission case.

(39) Install and torque the bolts to hold the extension/adaptor housing onto the transmission case. The correct torque is 54 N·m (40 ft.lbs.).

(40) Install the number 5 bearing and spacer onto the 4C retainer/bulkhead (Fig. 44).

(41) Install the input clutch assembly into the transmission case (Fig. 44). Make sure that the input clutch assembly is fully installed by performing a visual inspection through the input speed sensor hole. If the tone wheel on the input clutch assembly is visible, the assembly is fully installed.

(42) Install the number 1 bearing with the flat side down in the pocket of the input clutch assembly (Fig. 44).

(43) Install the oil pump into the transmission case (Fig. 45).

(44) Install the bolts to hold the oil pump into the transmission case. Tighten the oil pump bolts to 28 N·m (250 in.lbs.).

(45) Using Adapter 8266-1 from End-Play Tool Set 8266 and Dial Indicator C-3339, measure and record the input shaft end-play (Fig. 46). The correct end-play is 0.46-0.89 mm (0.018-0.035 in.). Adjust as nec-

essary. Install the chosen spacer on the number 5 bearing and re-measure end-play to verify selection.

NOTE: When measuring the input shaft end-play, two "stops" will be felt. When the input shaft is pushed inward and the dial indicator zeroed, the first "stop" felt when the input shaft is pulled outward is the movement of the input shaft in the input clutch housing hub. This value should not be included in the end-play measured value and there-

fore must be recorded and subtracted from the dial indicator reading.

(46) Install the transmission front cover into the transmission case (Fig. 47).

(47) Install the outer snap-ring to hold the transmission front cover into the transmission case (Fig. 47).

(48) Partially install the inner transmission front cover snap-ring onto the oil pump (Fig. 47).

80c07355

(54) Install the manual shift lever from the transmission. Torque the retaining cross-bolt to 16 N·m (140 in.lbs.).

AUTOMATIC TRANSMISSION - 545RFE (Continued)

INSTALLATION

(1) Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free of any debris. The hub must be smooth to avoid damaging pump seal at installation.

(2) If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.

(3) Lubricate oil pump seal lip with transmission fluid.

(4) Align converter and oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 52). Surface of converter lugs should be at least 13 mm (1/2 in.) to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

Fig. 52 Checking Torque Converter Seating - Typical

1 - SCALE
2 - STRAIGHTEDGE

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear

(11) Raise transmission and align converter with drive plate and converter housing with engine block.

(12) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(13) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(14) Install two bolts to attach converter housing to engine.

(15) Install remaining torque converter housing to engine bolts. Tighten to 68 N·m (50 ft.lbs.).

(16) Install rear transmission crossmember. Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).

(17) Install rear support to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).

(18) Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts to 47 N·m (35 ft.lbs.). Tighten the clevis bracket to rear support bolt to 68 N·m (50 ft.lbs.).

(19) Remove engine support fixture.

(20) Install new plastic retainer grommet on any shift cable that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into cable and to snap grommet onto lever.

(21) Connect gearshift cable to transmission.

(22) Connect wires to solenoid and pressure switch assembly connector, input and output speed sensors, and line pressure sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(23) Install all torque converter-to-driveplate bolts by hand.

(24) Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 31 N·m (270 in. lbs.).

(25) Install starter motor and cooler line bracket.

(26) Connect cooler lines to transmission.

(27) Install transmission fill tube.

(28) Install exhaust components.

(29) Install transfer case. Tighten transfer case nuts to 35 N·m (26 ft.lbs.).

(30) Install the transfer case shift cable to the cable support bracket and the transfer case shift lever.

(31) Install the transmission collar onto the transmission and the engine. Tighten the bolts to 54 N·m (40 ft.lbs.).

(32) Align and connect propeller shaft(s).

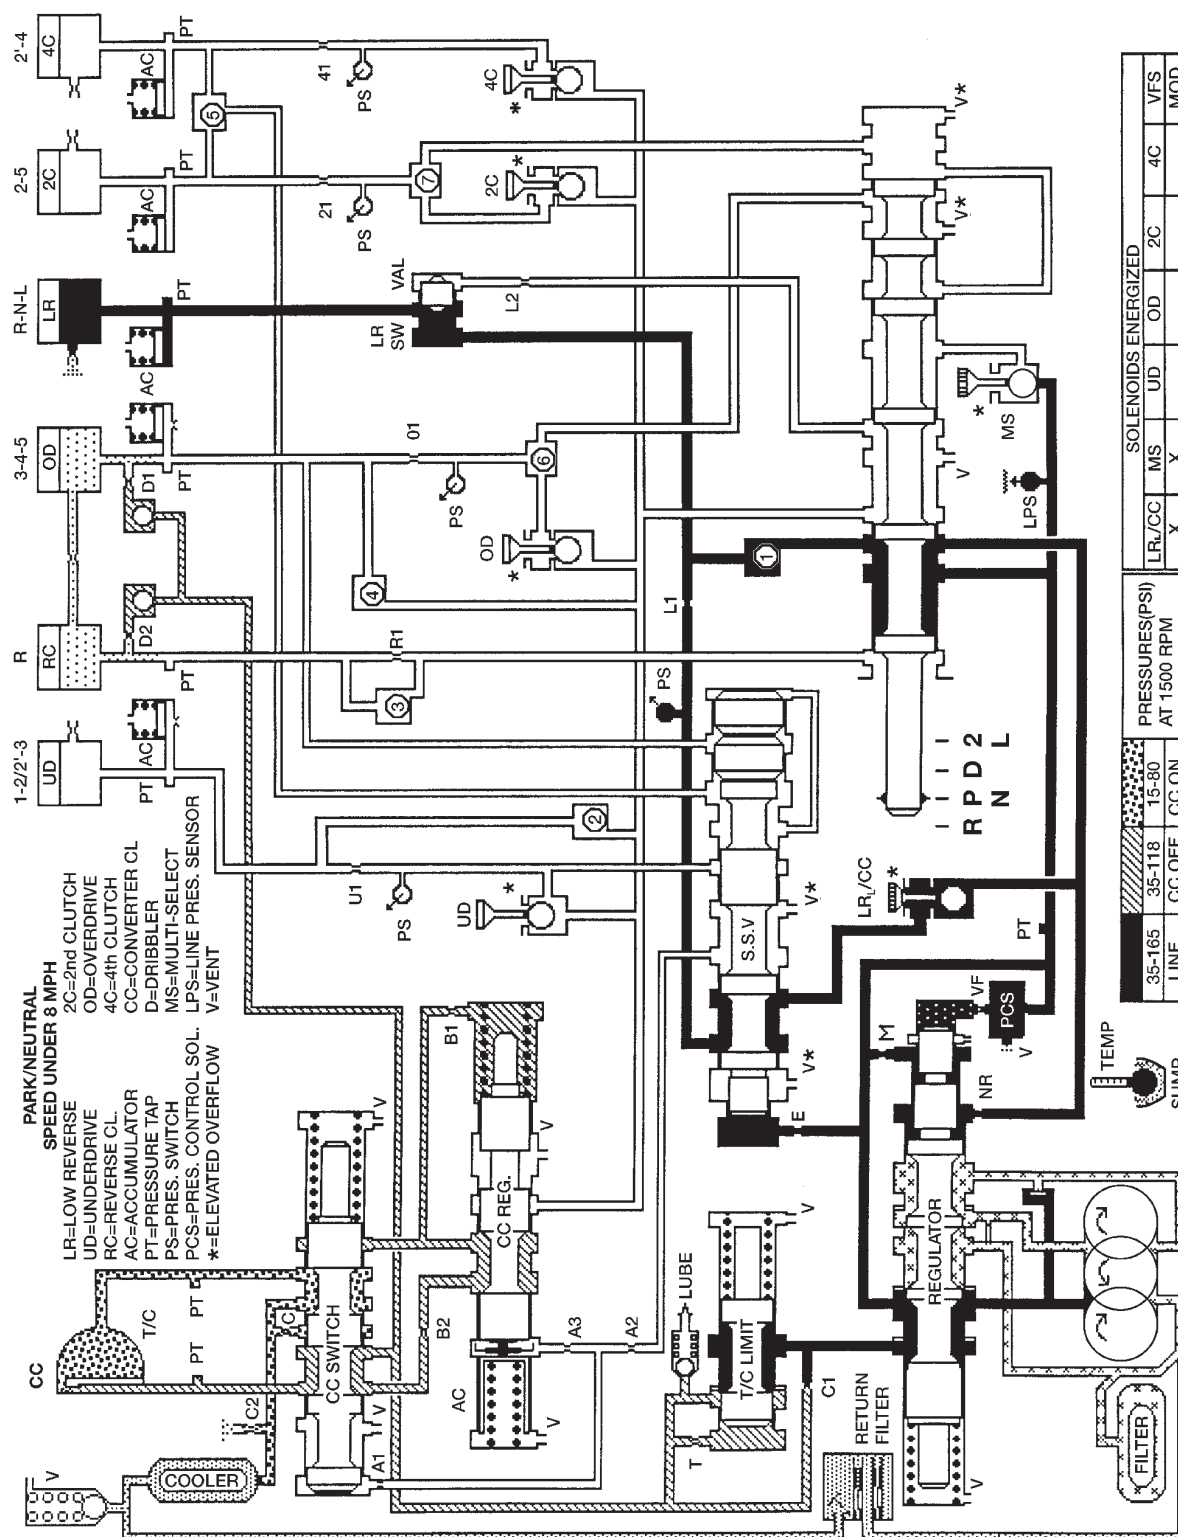

(33) Adjust gearshift cable if necessary.

(34) Lower vehicle.

(35) Fill transmission with Mopar® ATF +4, type 9602, Automatic Transmission fluid.

4C RETAINER/BULKHEAD

DISASSEMBLY

- (1) Remove the 2C piston belleville spring snap-ring from the 4C retainer /bulkhead (Fig. 53).
- (2) Remove the 2C piston Belleville spring from the retainer/bulkhead (Fig. 53).
- (3) Remove the 2C piston from the retainer/bulkhead. Use 20 psi of air pressure to remove the piston if necessary.
- (4) Remove the 4C clutch snap-ring from the retainer/bulkhead (Fig. 53).
- (5) Remove the 4C clutch pack from the retainer/bulkhead (Fig. 53).

(6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and remove the snap-ring (Fig. 53).

(7) Remove the 4C piston return spring and piston from the retainer/bulkhead (Fig. 53). Use 20 psi of air pressure to remove the piston if necessary.

ASSEMBLY

- (1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.
- (2) Install new seals on the 2C and 4C pistons (Fig. 53).
- (3) Lubricate all seals with Mopar® ATF +4, type 9602 prior to installation.

80c07032

4C RETAINER/BULKHEAD (Continued)

(4) Install the 4C piston into the 4C retainer/bulk-head (Fig. 53).

(5) Position the 4C piston return spring onto the 4C piston.

(6) Using Spring Compressor 8250 and a suitable shop press, compress the 4C piston return spring and install the snap-ring (Fig. 54).

80c07419

Fig. 54 Compress 4C Piston Return Spring Using Tool 8250

- 1 - PRESS
2 - TOOL 8250

(7) Assemble and install the 4C clutch pack into the retainer/bulkhead (Fig. 53).

(8) Install the 4C reaction plate and snap-ring into the retainer/bulkhead (Fig. 53). The 4C reaction plate is non-directional.

(9) Measure the 4C clutch clearance. The correct clutch clearance is 0.81-1.35 mm (0.032-0.053 in.). The snap-ring is selectable. Install the chosen snap-ring and re-measure to verify the selection.

(10) Install the 2C piston into the retainer/bulk-head (Fig. 53).

(11) Position the 2C Belleville spring onto the 2C piston.

(12) Position the 2C Belleville spring snap-ring onto the 2C Belleville spring (Fig. 53).

(13) Using Spring Compressor 8249 and a suitable shop press (Fig. 55), compress the belleville spring until the snap-ring is engaged with the snap-ring groove in the retainer/bulkhead.

80c07418

Fig. 55 Compress 2C Belleville Spring Using Tool 8249

- 1 - PRESS
2 - TOOL 8249

(2) Using a screw mounted on a slide hammer, remove the adapter housing seal.

INSTALLATION

(1) Clean the adapter seal bore in the adapter housing of any residue or particles remaining from the original seal.

(2) Install new oil seal in the adapter housing using Seal Installer C-3860-A (Fig. 56).

80c07424

Fig. 56 Adapter Housing Seal Installation

- 1 - TOOL C-3860-A

ADAPTER HOUSING SEAL

REMOVAL

(1) Remove the transfer case from the transmission.

(3) Install the transfer case onto the transmission.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM

DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 57).

OPERATION

The system locks the shifter into the PARK position. The interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed approximately one-half an inch. A magnetic holding device in line with the park lock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position, unless the shifter is fully locked into the PARK position.

80ba79c2

Fig. 57 Ignition Interlock Cable

- 1 - SHIFT MECHANISM
- 2 - SHIFTER BTSI LEVER
- 3 - ADJUSTMENT CLIP

- 4 - STEERING COLUMN ASSEMBLY
- 5 - INTERLOCK CABLE

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

(1) Verify that the key can only be removed in the PARK position

(2) When the shift lever is in PARK And the shift handle pushbutton is in the "OUT" position, the ignition key cylinder should rotate freely from OFF to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.

(3) Shifting out of PARK should be possible when the ignition key cylinder is in the OFF position.

(4) Shifting out of PARK should not be possible while applying normal pushbutton force and ignition key cylinder is in the RUN or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

(5) Shifting out of PARK should not be possible when the ignition key cylinder is in the ACCESSORY or LOCK positions.

(6) Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in RUN or START positions.

REMOVAL

(1) Lower the steering column.

(2) Disconnect the brake transmission shift interlock (BTSI) cable solenoid electrical connector (Fig. 58).

(3) With the ignition switch in the "RUN" position depress the BTSI cable locking tab, located on top of the cable connector (Fig. 58) at the steering column and pull the BTSI cable straight out.

(4) Disengage the wire connector at the solenoid on the cable

(5) Remove the transmission shift interlock cable from steering column (Fig. 59).

(6) Remove the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

80b6b3a0

- 4 - SHIFTER INTERLOCK CABLE CONNECTOR
- 5 - SHIFTER INTERLOCK SOLENOID CONNECTOR
- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

(7) Disconnect the BTSI cable from the shift BTSI lever and remove the cable from the shifter assembly bracket.

(8) Release the BTSI cable from any remaining clips.

(9) Remove BTSI cable from the vehicle.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

80ba79c2

- 1 - SHIFT MECHANISM
- 2 - SHIFTER BTSI LEVER
- 3 - ADJUSTMENT CLIP

- 4 - STEERING COLUMN ASSEMBLY
- 5 - INTERLOCK CABLE

INSTALLATION

NOTE: The gearshift cable must be secured into position and properly adjusted before the installation of the Brake Transmission Interlock Cable (BTISI).

- (1) Push the BTISI cable straight into the square mounting hole in the steering column until cable snaps in place (Fig. 60).
- (2) Snap BTISI cable solenoid tie strap into hole in steering column tube.
- (3) Engage the wiring connector from brake light switch into BTISI cable solenoid housing.
- (4) Route BTISI cable to the shifter mechanism.
- (5) Install the BTISI cable end fitting into shifter BTSI lever.
- (6) Snap BTISI cable adjuster ears into floor shifter bracket and
- (7) Place the ignition key cylinder in the LOCK position.
- (8) Push the cable adjuster lock clamp downward to lock it.
- (9) Test the BTISI cable operation.

- (10) Install the floor console and related trim. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

ADJUSTMENT PROCEDURE

- (1) Remove floor console as necessary for access to the brake transmission shift interlock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
- (2) Shift the transmission into the PARK position.
- (3) Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**
- (4) Pull cable lock button up to release cable (Fig. 61).
- (5) Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM (Continued)

80b6b3a0

Fig. 60 BTSI Solenoid Connector Location

- 5 - SHIFTER INTERLOCK SOLENOID CONNECTOR
- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

- (6) Push lock button down until it snaps in place.

BTSI FUNCTION CHECK

- (1) Verify removal of ignition key allowed in PARK position only.
- (2) When the shift lever is in PARK, and the shift handle push-button is in the out position, the ignition key cylinder should rotate freely from off to lock. When the shifter is in any other position, the ignition key should not rotate from off to lock.
- (3) Shifting out of PARK should be possible when the ignition key cylinder is in the off position.
- (4) Shifting out of PARK should not be possible while applying normal push-button force, and ignition key cylinder is in the run or start positions, unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
- (5) Shifting out of PARK should not be possible when the ignition key cylinder is in the accessory or lock position.
- (6) Shifting between any gear and NEUTRAL, or PARK, may be done without depressing foot brake with ignition switch in run or start positions.

(7) The floor shifter lever and gate positions should be in alignment with all transmission detent positions.

(8) Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.

(9) With shifter lever handle push-button not depressed and lever detent in:

- PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.
- PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.
- NEUTRAL position- engine start must be possible.
- NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

FLUID AND FILTER**DIAGNOSIS AND TESTING - EFFECTS OF INCORRECT FLUID LEVEL**

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

DIAGNOSIS AND TESTING - CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling sys-

- 3 - ADJUSTMENT CLIP

- 4 - STEERING COLUMN ASSEMBLY
- 5 - INTERLOCK CABLE

tem, and the engine/axle ratio combination needed to handle heavy loads.

DIAGNOSIS AND TESTING - FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and

other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems have developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

FLUID AND FILTER (Continued)

STANDARD PROCEDURES - FLUID LEVEL CHECK

Low fluid level can cause a variety of conditions because it allows the pump to take in air along with the fluid. As in any hydraulic system, air bubbles make the fluid spongy, therefore, pressures will be low and build up slowly.

Improper filling can also raise the fluid level too high. When the transmission has too much fluid, the geartrain churns up foam and cause the same conditions which occur with a low fluid level.

In either case, air bubbles can cause overheating and/or fluid oxidation, and varnishing. This can interfere with normal valve, clutch, and accumulator operation. Foaming can also result in fluid escaping from the transmission vent where it may be mistaken for a leak.

Along with fluid level, it is important to check the condition of the fluid. When the fluid smells burned, and is contaminated with metal or friction material particles, a complete transmission recondition is needed. Be sure to examine the fluid on the dipstick closely. If there is any doubt about its condition, drain out a sample for a double check.

After the fluid has been checked, seat the dipstick fully to seal out water and dirt.

The transmission has a dipstick to check oil level. It is located on the right side of the engine. Be sure to wipe all dirt from dipstick handle before removing.

The torque converter fills in both the P (PARK) and N (NEUTRAL) positions. Place the selector lever in P (PARK) to be sure that the fluid level check is accurate. **The engine should be running at idle speed for at least one minute, with the vehicle on level ground.** At normal operating temperature (approximately 82 C. or 180 F.), the fluid level is correct if it is in the HOT region (cross-hatched area) on the oil level indicator. The fluid level will be approximately at the upper COLD hole of the dipstick at 70° F fluid temperature.

NOTE: Engine and Transmission should be at normal operating temperature before performing this procedure.

- (1) Start engine and apply parking brake.
- (2) Shift the transmission into DRIVE for approximately 2 seconds.
- (3) Shift the transmission into REVERSE for approximately 2 seconds.
- (4) Shift the transmission into PARK.
- (5) Hook up DRB® scan tool and select transmission.

Transmission Fluid Temperature Chart

FLUID AND FILTER (Continued)

- (6) Select sensors.
- (7) Read the transmission temperature value.
- (8) Compare the fluid temperature value with the chart.
- (9) Adjust transmission fluid level shown on the dipstick according to the chart.

NOTE: After adding any fluid to the transmission, wait a minimum of 2 minutes for the oil to fully drain from the fill tube into the transmission before rechecking the fluid level.

- (10) Check transmission for leaks.

STANDARD PROCEDURES - FLUID AND FILTER REPLACEMENT

For proper service intervals (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Place a large diameter shallow drain pan beneath the transmission pan.
- (3) Remove bolts holding front and sides of pan to transmission.
- (4) Loosen bolts holding rear of pan to transmission.
- (5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
- (6) Hold up pan and remove remaining bolt holding pan to transmission.
- (7) While holding pan level, lower pan away from transmission.
- (8) Pour remaining fluid in pan into drain pan.
- (9) Remove screws holding filter to valve body (Fig. 62).
- (10) Separate filter from valve body and oil pump and pour fluid in filter into drain pan.
- (11) Remove and discard the oil filter seal from the bottom of the oil pump.
- (12) Using Oil Filter Wrench 8321, remove the cooler return filter from the transmission.
- (13) Dispose of used trans fluid and filter properly.

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch material on the bottom of the pan does not indicate a problem unless accompanied by a slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts or debris, refer to the diagnosis section of this group.

80b9a595

Fig. 62 Transmission Filters - 4X4 Shown

- 1 - PRIMARY OIL FILTER
- 2 - COOLER RETURN FILTER
- 3 - FILTER BYPASS VALVE
- 4 - VALVE BODY

CLEANING

- (1) Using a suitable solvent, clean pan and magnet.
- (2) Using a suitable gasket scraper, clean original sealing material from surface of transmission case and the transmission pan.

INSTALLATION

- (1) Install a new oil filter seal into the bottom of the oil pump.

NOTE: Do not attempt to install the seal onto the oil filter first and then into the oil pump. An unsatisfactory seal between the oil pump and filter will result, allowing air to be drawn into the pump.

- (2) Place replacement filter in position on valve body and into the oil pump.
- (3) Install screws to hold filter to valve body (Fig. 62). Tighten screws to 4.5 N·m (40 in. lbs.) torque.
- (4) Install new cooler return filter onto the transmission. Torque the filter to 14.12 N·m (125 in. lbs.).
- (5) Place bead of Mopar® RTV sealant onto the transmission case sealing surface.
- (6) Place pan in position on transmission.
- (7) Install screws to hold pan to transmission. Tighten bolts to 11.8 N·m (105 in. lbs.) torque.
- (8) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602 fluid.

STANDARD PROCEDURES - TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

FLUID AND FILTER (Continued)

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF +4 to transmission:

(a) If only fluid and filter were changed, add **10 pints (5 quarts)** of ATF +4 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **24 pints (12 quarts)** of ATF +4 to transmission.

(3) Check the transmission fluid (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/FLUID - STANDARD PROCEDURE).

GEARSHIFT CABLE

DIAGNOSIS AND TESTING - GEARSHIFT CABLE

(1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.

(2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.

(3) With floor shift lever handle push-button not depressed and lever in:

(a) PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.

(b) PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position - Normal position. Engine starts must be possible.

(d) NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

REMOVAL

(1) Shift transmission into PARK.

(2) Raise vehicle.

(3) Remove the shift cable eyelet from the transmission manual shift lever (Fig. 63).

(4) Remove shift cable from the cable support bracket.

(5) Lower vehicle.

(6) Remove necessary console parts for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(7) Disconnect cable at shift lever and shifter assembly bracket (Fig. 64).

(8) Remove the nuts holding the shift cable seal plate to the floor pan (Fig. 65).

80ba79c4

Fig. 63 Remove Shift Cable From Transmission

- 3 - SHIFT CABLE
- 4 - SHIFTER ASSEMBLY BRACKET

(10) Remove shift cable from vehicle.

INSTALLATION

(1) Route cable through hole in floor pan.

(2) Install seal plate to studs in floor pan.

(3) Install nuts to hold seal plate to floor pan. Tighten nuts to 7 N·m (65 in.lbs.).

(4) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.

(5) Place the floor shifter lever in PARK position.

(6) Loosen the adjustment screw on the shift cable.

(7) Snap the shift cable onto the shift lever pin.

GEARSHIFT CABLE (Continued)

**Fig. 65 Shift Cables at Floor Pan**

- 1 - SEAL PLATES
2 - TRANSMISSION SHIFT CABLE
3 - TRANSFER CASE SHIFT CABLE

- (8) Raise the vehicle.
(9) Install the shift cable to the shift cable support bracket.
(10) Shift the transmission into PARK. PARK is the rearmost detent position on the transmission manual shift lever.
(11) Snap the shift cable onto the transmission manual shift lever.
(12) Lower vehicle.
(13) Verify that the shift lever is in the PARK position.
(14) Tighten the adjustment screw to 7 N·m (65 in.lbs.).
(15) Verify correct shifter operation.
(16) Install any console parts removed for access to shift lever assembly and shift cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position switch or TRS may be faulty.

Gearshift Adjustment Procedure

- (1) Shift transmission into PARK.
(2) Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
(3) Loosen the shift cable adjustment screw (Fig. 66).

**Fig. 66 Shift Cable at the Shifter**

- 1 - SHIFT LEVER PIN
2 - ADJUSTMENT SCREW
3 - SHIFT CABLE
4 - SHIFTER ASSEMBLY BRACKET

- (4) Raise vehicle.
(5) Unsnap cable eyelet from transmission shift lever.
(6) Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
(7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
(8) Snap cable eyelet onto transmission shift lever.
(9) Lower vehicle
(10) Tighten the shift cable adjustment screw to 7 N·m (65 in.lbs.).
(11) Verify correct operation.
(12) Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

HOLDING CLUTCHES

DESCRIPTION

Three hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2C, 4C, and Low/Reverse clutches are considered holding clutches. The 2C and 4C clutches are located in the 4C retainer/bulkhead (Fig. 67), while the Low/Reverse clutch is located at the rear of the transmission case (Fig. 68).

OPERATION

2C CLUTCH

The 2C clutch is hydraulically applied in second and fifth gear by pressurized fluid against the 2C piston. When the 2C clutch is applied, the reverse sun gear assembly is held or grounded to the transmission case by holding the reaction planetary carrier.

4C CLUTCH

The 4C clutch is hydraulically applied in second prime and fourth gear by pressurized fluid against the 4C clutch piston. When the 4C clutch is applied, the reaction annulus gear is held or grounded to the transmission case.

INPUT CLUTCH ASSEMBLY

DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive, overdrive, and reverse clutches are considered input clutches and are contained within the input clutch assembly (Fig. 69) and (Fig. 70). The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer

- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, second prime, and third (direct) gears

by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the input sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct), fourth, and fifth gears by pressurized fluid against the overdrive/reverse piston. When the

overdrive clutch is applied, the overdrive hub drives the reverse carrier/input annulus assembly.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the reaction annulus gear is driven.

DISASSEMBLY

(1) Remove the reverse reaction plate selective snap-ring from the input clutch retainer (Fig. 71).

(2) Remove the reverse reaction plate from the input clutch retainer.

(3) Remove the reverse hub and reverse clutch pack from the input clutch retainer.

(4) Remove the number 4 bearing from the overdrive hub.

(5) Remove the overdrive hub from the input clutch retainer (Fig. 71).

(6) Remove the number 3 bearing from the underdrive hub.

(7) Remove the OD/reverse reaction plate snap-ring from the input clutch retainer.

(8) Remove the underdrive hub, overdrive clutch, and overdrive reaction plate from the input clutch retainer (Fig. 71).

- 18 - BEARING NUMBER 2

INPUT CLUTCH ASSEMBLY (Continued)

NOTE: The overdrive friction discs and steel discs are thicker than the matching components in the underdrive and reverse clutches.

(9) Remove the number 2 bearing from the input clutch hub.

(10) Remove the overdrive clutch wave snap-ring from the input clutch retainer.

(11) Remove the UD/OD reaction plate tapered snap-ring from the input clutch retainer.

(12) Remove the UD/OD reaction plate from the input clutch retainer.

(13) Remove the UD/OD reaction plate flat snap-ring from the input clutch retainer (Fig. 71).

(14) Remove the underdrive clutch pack from the input clutch retainer (Fig. 73).

(15) Using Spring Compressor 8251, compress the UD/OD balance piston and remove the snap-ring from the input clutch hub (Fig. 72).

(16) Remove the UD/OD balance piston and piston return spring from the input clutch retainer (Fig. 73).

(17) Remove the underdrive piston from the input clutch retainer (Fig. 73).

NOTE: Both the UD/OD balance piston and the underdrive piston have seals molded onto them. If the seal is damaged, do not attempt to install a new seal onto the piston. The piston/seal must be replaced as an assembly.

(18) Remove the input clutch retainer tapered snap-ring.

(19) Separate input clutch retainer from input clutch hub.

(20) Separate OD/reverse piston from input clutch hub retainer (Fig. 73).

(21) Remove all seals and o-rings from the input shaft and input hub. The o-rings on the input hub are color coded. Be sure to make note of which o-ring belongs in which location.

ASSEMBLY

(1) Install all new seals and o-rings onto the input shaft and input hub. The o-rings on the input hub are

80c07426

Fig. 72 Compressing UD/OD Balance Piston Using Tool 8251

- 1 - PRESS
- 2 - TOOL 8251
- 3 - BALANCE PISTON

color coded. Be sure to install the correct o-ring in the correct location.

(2) Check the transmission lubrication check valve located in the input shaft using shop air. The valve should only allow air flow in one direction. If the valve allows no air flow, or air flow in both directions, the valve will need to be replaced.

(3) Lubricate all seals with Mopar® ATF +4, type 9602, prior to installation.

(4) Assemble the OD/reverse piston onto the input clutch hub (Fig. 74).

(5) Assemble the input clutch retainer onto the input clutch hub.

(6) Install the input clutch retainer tapered snap-ring with tapered side up onto the input clutch hub.

3 - BALANCE PISTON

(13) Install the underdrive clutch pack into the input clutch retainer (Fig. 74).

(14) Install the UD/OD reaction plate lower flat snap-ring (Fig. 78). The correct snap-ring can be identified by the two tabbed ears.

(15) Install the UD/OD reaction plate into the input clutch retainer. The reaction plate is to be installed with the big step down.

(16) Install the UD/OD reaction plate upper tapered snap-ring with tapered side up.

(17) Install the input clutch assembly into Input Clutch Pressure Fixture 8260 (Fig. 79). Mount a dial indicator to the assembly, push down on the clutch discs and zero the indicator against the underdrive clutch discs (Fig. 80). Apply 20 psi of air pressure to the underdrive clutch and record the dial indicator reading. Measure and record UD clutch pack measurement in four (4) places, 90° apart. Take average of four measurements and compare with UD clutch pack clearance specification. The correct clutch clearance is 0.76-1.16 mm (0.030-0.063 in.). The reaction plate is not selective. If the clutch clearance is not within specification, replace the reaction plate along with all the friction and steel discs.

(18) Install the overdrive clutch pack into the input clutch retainer (Fig. 78). The overdrive steel

(36) Push up on reaction plate to allow reverse clutch to move freely.

INPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

- (1) Raise vehicle.
(2) Place a suitable fluid catch pan under the transmission.
(3) Remove the wiring connector from the input speed sensor (Fig. 83).
(4) Remove the bolt holding the input speed sensor to the transmission case.
(5) Remove the input speed sensor from the transmission case.

80c07350

Fig. 83 Input Speed Sensor

3 - INPUT SPEED SENSOR

INSTALLATION

- (1) Install the input speed sensor into the transmission case.
(2) Install the bolt to hold the input speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
(3) Install the wiring connector onto the input speed sensor
(4) Verify the transmission fluid level. Add fluid as necessary.
(5) Lower vehicle.

LINE PRESSURE (LP) SENSOR

DESCRIPTION

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid, mounted on the side of the solenoid and pressure switch assembly. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the line pressure sensor (Fig. 84).
- (4) Remove the bolt holding the line pressure sensor to the transmission case.

- (5) Remove the line pressure sensor from the transmission case.

80c07350

Fig. 84 Line Pressure Sensor

- 1 - OUTPUT SPEED SENSOR
- 2 - LINE PRESSURE SENSOR
- 3 - INPUT SPEED SENSOR

INSTALLATION

- (1) Install the line pressure sensor into the transmission case.
- (2) Install the bolt to hold the line pressure sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the line pressure sensor
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

LOW/REVERSE CLUTCH

DISASSEMBLY

(1) Remove the inner overrunning clutch snap-ring from the low/reverse clutch retainer (Fig. 85).

(2) Remove the outer low/reverse reaction plate flat snap-ring (Fig. 85).

(3) Remove the low/reverse clutch and the overrunning clutch from the low/reverse clutch retainer as an assembly (Fig. 85).

(4) Separate the low/reverse clutch from the overrunning clutch.

(5) Remove the overrunning clutch snap-ring (Fig. 86).

(6) Remove the spacer from the overrunning clutch (Fig. 86).

(7) Separate the inner and outer races of the overrunning clutch (Fig. 86).

(8) Remove the overrunning clutch lower snap-ring (Fig. 86).

Fig. 85 Low/Reverse Clutch Assembly

- 4 - SPACER

(9) Using Spring Compressor 8285 and a suitable shop press (Fig. 87), compress the low/reverse piston Belleville spring and remove the split retaining ring holding the Belleville spring into the low/reverse clutch retainer.

80c07420

Fig. 87 Compress Low/Reverse Belleville Spring Using Tool 8285

- 1 - PRESS
- 2 - TOOL 8285
- 3 - BELLEVILLE SPRING

(10) Remove the low/reverse clutch Belleville spring and piston from the low/reverse clutch retainer. Use 20 psi of air pressure to remove the piston if necessary.

CLEANING

Clean the overrunning clutch assembly, clutch cam, and low-reverse clutch retainer. Dry them with compressed air after cleaning.

INSPECTION

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse clutch retainer if the clutch race, roller surface or inside diameter is scored, worn or damaged.

ASSEMBLY

(1) Check the bleed orifice to ensure that it is not plugged or restricted.

(2) Install a new seal on the low/reverse piston. Lubricate the seal with Mopar® ATF +4, type 9602, prior to installation.

(3) Install the low/reverse piston into the low/reverse clutch retainer.

(4) Position the low/reverse piston Belleville spring on the low/reverse piston.

(5) Using Spring Compressor 8285 and a suitable shop press (Fig. 87), compress the low/reverse piston Belleville spring and install the split retaining ring to hold the Belleville spring into the low/reverse clutch retainer.

(6) Install the lower overrunning clutch snap-ring (Fig. 86).

(7) Assemble the inner and outer races of the overrunning clutch (Fig. 86).

(8) Position the overrunning clutch spacer on the overrunning clutch.

(9) Install the upper overrunning clutch snap-ring (Fig. 86).

(10) Assemble and install the low/reverse clutch pack into the low/reverse clutch retainer (Fig. 85).

(11) Install the low/reverse reaction plate into the low/reverse clutch retainer (Fig. 85). The reaction plate is directional and must be installed with the flat side down.

(12) Install the low/reverse clutch pack snap-ring (Fig. 85). The snap-ring is selectable and should be chosen to give the correct clutch pack clearance.

(13) Measure the low/reverse clutch pack clearance and adjust as necessary. The correct clutch clearance is 1.14-1.91 mm (0.045-0.075 in.).

LOW/REVERSE CLUTCH (Continued)

(14) Install the overrunning clutch into the low/reverse clutch retainer making sure that the index splines are aligned with the retainer.

(15) Install the overrunning clutch inner snap-ring.

OIL PUMP

DESCRIPTION

The oil pump (Fig. 88) is located at the front of the transmission inside the bell housing and behind the transmission front cover. The oil pump consists of two independent pumps (Fig. 89), a number of valves (Fig. 90), a front seal (Fig. 91), and a bolt on reaction shaft. The converter clutch switch and regulator valves, pressure regulator valve, and converter pressure limit valve are all located in the oil pump housing.

OIL PUMP (Continued)

OPERATION

As the torque converter rotates, the converter hub rotates the oil pump drive gear. As the drive gear rotates both driven gears, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the oil pump valves.

At low speeds, both pumps supply fluid to the transmission. As the speed of the torque converter increases, the pressure output of both pumps increases until the primary pump pressure reaches the point where it can close off the check valve located between the two pumps. When the check valve is closed, the secondary pump is shut down and the primary pump supplies all the fluid to the transmission.

CONVERTER CLUTCH SWITCH VALVE

The converter clutch switch valve is used to control the hydraulic pressure supplied to the front (OFF) side of the torque converter clutch.

CONVERTER CLUTCH REGULATOR VALVE

The converter clutch regulator valve is used to control the hydraulic pressure supplied to the back (ON) side of the torque converter clutch.

TORQUE CONVERTER LIMIT VALVE

The torque converter limit valve serves to limit the available line pressure to the torque converter clutch to approximately 120 psi.

STANDARD PROCEDURES - OIL PUMP
VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF +4, type 9602, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at 1800 rpm**, with the shift selector in neutral. Verify that the transmission fluid temperature is below 104.5° C (220° F) for this test.

(3) If one quart of transmission fluid is collected in the container in 30 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 30 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

DISASSEMBLY

(1) Remove the bolts holding the reaction shaft support to the oil pump (Fig. 92).

(2) Remove the reaction shaft support from the oil pump (Fig. 92).

(3) Remove all bolts holding the oil pump halves together (Fig. 92).

(4) Using suitable prying tools, separate the oil pump sections by inserting the tools in the supplied areas and prying the halves apart.

NOTE: The oil pump halves are aligned to each other through the use of two dowels. Be sure to pry upward evenly to prevent damage to the oil pump components.

(5) Remove the screws holding the separator plate onto the oil pump body (Fig. 93).

(6) Remove the separator plate from the oil pump body (Fig. 93).

(7) Mark all gears for location. The gears are select fit and if the oil pump is to be reused, the gears must be returned to their original locations.

(8) Remove the oil pump gears from the oil pump case (Fig. 93).

(9) Remove the oil pump valve retainers and associated valve and spring one at a time (Fig. 94) (Fig. 95). Mark the combination of components as a group and tag them as to the location from which they were removed.

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or dam-

- 3 - OIL FILTER SEAL

- 4 - SEAL RING (5)
- 5 - REACTION SHAFT SUPPORT
- 6 - VALVE BODY

aged. Replace the pump gears if pitted, worn chipped, or damaged.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the oil pump cover. Use a penlight to view the bore interiors. Replace the oil pump if any bores are distorted or scored. Inspect all of the valve springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

ASSEMBLY

(1) Clean and inspect all components. Make sure that all passages are thoroughly cleaned and are free from dirt or debris. Make sure that all valves move

OIL PUMP (Continued)

- 7 - SCREW

freely in their proper bore. Make sure that all gear pockets and bushings are free from excessive wear and scoring. Replace the oil pump if any excessive wear or scoring is found.

(2) Coat the gears with Mopar® ATF +4, type 9602, and install into their original locations.

(3) Lubricate the oil pump valves with Mopar® ATF +4, type 9602, and install the valve, spring and retainer into the appropriate oil pump valve body bore (Fig. 94) (Fig. 95).

(4) Place the separator plate onto the oil pump body (Fig. 93).

(5) Install the screws to hold the separator plate onto the oil pump body (Fig. 93). Tighten the screws to 4.5 N·m (40 in.lbs.).

(6) Position the oil pump cover onto the locating dowels (Fig. 92).

(7) Seat the two oil pump halves together and install all bolts finger tight.

(8) Torque all bolts down slowly starting in the center and working outward. The correct torque is 4.5 N·m (40 in.lbs.).

(9) Verify that the oil pump gears rotate freely and smoothly.

(10) Position the reaction shaft support into the oil pump (Fig. 92).

(11) Install and torque the bolts to hold the reaction shaft support to the oil pump (Fig. 92). The correct torque is 12 N·m (105 in.lbs.).

OIL PUMP FRONT SEAL

REMOVAL

- (1) Remove transmission from the vehicle.
- (2) Remove the torque converter from the transmission.
- (3) Using a screw mounted in a slide hammer, remove the oil pump front seal.

INSTALLATION

- (1) Clean seal bore of the oil pump of any residue or particles from the original seal.
- (2) Install new oil seal in the oil pump housing using Seal Installer C-3860-A (Fig. 96).

80c07423

Fig. 96 Install Oil Pump Front Seal

OUTPUT SPEED SENSOR

DESCRIPTION

The Input and Output Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

REMOVAL

- (1) Raise vehicle.
- (2) Place a suitable fluid catch pan under the transmission.
- (3) Remove the wiring connector from the output speed sensor (Fig. 97).
- (4) Remove the bolt holding the output speed sensor to the transmission case.
- (5) Remove the output speed sensor from the transmission case.

INSTALLATION

- (1) Install the output speed sensor into the transmission case.
- (2) Install the bolt to hold the output speed sensor into the transmission case. Tighten the bolt to 11.9 N·m (105 in.lbs.).
- (3) Install the wiring connector onto the output speed sensor
- (4) Verify the transmission fluid level. Add fluid as necessary.
- (5) Lower vehicle.

- 3 - INPUT SPEED SENSOR

OVERDRIVE SWITCH

DESCRIPTION

The overdrive OFF (control) switch is located in the shifter handle. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function.

OPERATION

At key-on, fourth and fifth gear operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoids and allow upshifts to fourth and fifth gears. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are

PISTONS (Continued)

round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 98) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

80bfe272

Fig. 98 Force and Pressure Relationship

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 99) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

80bfe273

Fig. 99 Pressure on a Confined Fluid

PISTONS (Continued)

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 100), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 100), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

80bfe274

Fig. 100 Force Multiplication

PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 101) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

80bfe275

Fig. 101 Piston Travel

PLANETARY GEARTRAIN

DESCRIPTION

The planetary geartrain is located behind the 4C retainer/bulkhead, toward the rear of the transmission. The planetary geartrain consists of three primary assemblies:

- Reaction (Fig. 102).
- Reverse (Fig. 103).
- Input (Fig. 103).

OPERATION

REACTION PLANETARY GEARTRAIN

The reaction planetary carrier and reverse sun gear of the reaction planetary geartrain are a single component which is held by the 2C clutch when required. The reaction annulus gear is a stand alone

component that can be driven by the reverse clutch or held by the 4C clutch. The reaction sun gear is driven by the overdrive clutch.

REVERSE PLANETARY GEARTRAIN

The reverse planetary geartrain is the middle of the three planetary sets. The reverse planetary carrier can be driven by the overdrive clutch as required. The reverse planetary carrier is also splined to the input annulus gear, which can be held by the low/reverse clutch. The reverse planetary annulus, input planetary carrier, and output shaft are all one piece.

INPUT PLANETARY GEARTRAIN

The input sun gear of the input planetary geartrain is driven by the underdrive clutch.

- 5 - INPUT PLANETARY CARRIER
- 6 - INPUT SUN GEAR
- 7 - REVERSE PLANETARY CARRIER

DISASSEMBLY

- (1) Remove the snap-ring holding the input annulus into the input carrier (Fig. 104).
- (2) Remove the input annulus from the input carrier (Fig. 104).
- (3) Remove the number 9 bearing from the reverse planetary carrier. Note that this planetary carrier has four pinion gears.
- (4) Remove the reverse planetary gear carrier (Fig. 104).
- (5) Remove the number 10 bearing from the input sun gear (Fig. 104).
- (6) Remove the input sun gear from the input carrier (Fig. 104).
- (7) Remove the number 11 bearing from the input carrier (Fig. 104).

CLEANING

Clean the planetary components in solvent and dry them with compressed air.

INSPECTION

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location.

ASSEMBLY

(1) Clean and inspect all components. Replace any components which show evidence of excessive wear or scoring.

(2) Install the number 11 bearing into the input planetary carrier with the flat side up and facing forward (Fig. 104).

PLANETARY GEARTRAIN (Continued)

- 7 - REVERSE PLANETARY CARRIER

(3) Install the input sun gear into the input carrier (Fig. 104).

(4) Install the number 10 bearing onto the rear of the reverse planetary carrier with the flat side toward the carrier (Fig. 104).

(5) Install the number 9 bearing onto the front of the reverse planetary carrier with the rounded side toward the carrier and the flat side facing upward (Fig. 104).

(6) Install the reverse planetary gear carrier into the input carrier (Fig. 104).

(7) Install the input annulus gear into the input carrier (Fig. 104).

(8) Install the snap-ring to hold the input annulus gear into the input carrier (Fig. 104).

- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual second (2)
- Manual low (1)

OPERATION

MANUAL LOW (1) range provides FIRST gear only. Overrun braking is also provided in this range. MANUAL SECOND (2) range provides FIRST and SECOND gear only.

DRIVE range provides FIRST, SECOND, THIRD and OVERDRIVE FOURTH and FIFTH gear ranges. The shift into OVERDRIVE FOURTH and FIFTH gear range occurs only after the transmission has completed the shift into D THIRD gear range. No further movement of the shift mechanism is required to complete the 3-4 or 4-5 shifts.

The FOURTH and FIFTH gear upshifts occurs automatically when the overdrive selector switch is in the ON position. An upshift to FOURTH and FIFTH gears may not occur or may be delayed in

SHIFT MECHANISM**DESCRIPTION**

The gear shift mechanism provides six shift positions which are:

- Park (P)

SHIFT MECHANISM (Continued)

some of the possible shift schedules. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - OPERATION)

REMOVAL

(1) Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

(2) Shift transmission into PARK.

(3) Disconnect the transmission shift cable at shift lever and shifter assembly bracket (Fig. 105).

(4) Disconnect the brake transmission interlock cable (Fig. 106) from the shifter BTSI lever and the shifter assembly bracket.

(5) Disconnect the transfer case shift cable from the transfer case shift lever pin (Fig. 107).

(6) Remove the clip holding the transfer case shift cable to the shifter assembly bracket.

(7) Remove the transfer case shift cable from the shifter assembly bracket.

(8) Disengage all wiring connectors from the shifter assembly.

(9) Remove all nuts holding the shifter assembly to the floor pan (Fig. 108).

**Fig. 108 Shifter Assembly**

- 1 - FLOOR PAN
- 2 - SHIFTER ASSEMBLY

INSTALLATION

- (1) Install shifter assembly onto the shifter assembly studs on the floor pan.
- (2) Install the nuts to hold the shifter assembly onto the floor pan. Tighten nuts to 28 N·m (250 in.lbs.).
- (3) Install wiring harness to the shifter assembly bracket. Engage any wire connectors removed from the shifter assembly.
- (4) Install the transfer case shift cable to the shifter assembly bracket. Install clip to hold cable to the bracket.

(5) Snap the transfer case shift cable onto the transfer case shift lever pin.

(6) Install the brake transmission interlock cable into the shifter assembly bracket and into the shifter BTSI lever. (Refer to 21 - TRANSMISSION/TRAN-SAXLE/AUTOMATIC/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)

(7) Install the shift cable to the shifter assembly bracket. Push cable into the bracket until secure.

(8) Place the floor shifter lever in park position.

(9) Loosen the adjustment screw on the shift cable.

(10) Snap the shift cable onto the shift lever pin.

(11) Verify that the shift lever is in the PARK position.

(12) Tighten the adjustment screw to 7 N·m (65 in.lbs.).

(13) Verify correct shifter operation.

(14) Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

SOLENOID SWITCH VALVE**DESCRIPTION**

The Solenoid Switch Valve (SSV) is located in the valve body and controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

OPERATION

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and 5th gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

SOLENOIDS

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

- Increase the amount of current applied to the coil or
- Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-

width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 109) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump and contains an o-ring seal to better control oil flow.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

TURBINE

The turbine (Fig. 111) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

TORQUE CONVERTER (Continued)

STATOR

The stator assembly (Fig. 112) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 113). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

**Fig. 112 Stator Components**

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 114) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed

TORQUE CONVERTER (Continued)

- Engine speed

OPERATION

The converter impeller (Fig. 115) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 116). Under stall conditions (the turbine is stationary), the

oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges depending on overdrive control

Fig. 115 Torque Converter Fluid Operation - Typical

switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.
- (4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. Verify that the converter hub o-ring is properly installed and is free from debris. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate oil pump seal lip with transmission fluid.
- (2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub o-ring while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
- (6) Check converter seating with a scale and straightedge (Fig. 117). Surface of converter lugs

TORQUE CONVERTER (Continued)

should be at least 13 mm (1/2 in.) to rear of straight-edge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

2 - STRAIGHTEDGE

TRANSMISSION CONTROL RELAY

DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

OPERATION

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

TRANSMISSION RANGE SENSOR

DESCRIPTION

The Transmission Range Sensor (TRS) is mounted to the top of the valve body inside the transmission.

The Transmission Range Sensor (TRS) has six switch contacts that:

- Determine shift lever position
- Supply ground to the Starter Relay in Park and Neutral only.
- Supply ground to the TCM for backup lamp control in Reverse only.

The TRS also has an integrated temperature sensor (thermistor) that communicates transmission temperature to the TCM and PCM.

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

There are many possible combinations of open and closed switches (codes). Seven of these possible codes are related to gear position and five are recognized as "between gear" codes. This results in many codes which should **never occur**. These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

TRANSMISSION SOLENOID/ TRS ASSEMBLY

DESCRIPTION

The transmission solenoid/TRS assembly is internal to the transmission and mounted on the valve body assembly (Fig. 118). The assembly consists of six solenoids that control hydraulic pressure to the six friction elements (transmission clutches), and the torque converter clutch. The pressure control solenoid is located on the side of the solenoid/TRS assembly. The solenoid/TRS assembly also contains five pressure switches that feed information to the TCM.

80b9a590

Fig. 118 Transmission Solenoid/TRS Assembly

- 1 - PRESSURE CONTROL SOLENOID
- 2 - TRANSMISSION RANGE SENSOR
- 3 - 23-WAY CONNECTOR
- 4 - SOLENOID PACK

OPERATION

SOLENOIDS

Solenoids are used to control the L/R, 2C, 4C, OD, and UD friction elements. The reverse clutch is controlled by line pressure and the position of the manual valve in the valve body. All the solenoids are contained within the Solenoid and Pressure Switch Assembly. The solenoid and pressure switch assembly contains one additional solenoid, Multi-Select (MS), which serves primarily to provide 2nd and 3rd gear limp-in operation.

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid as necessary. When a solenoid is energized, the solenoid

valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The MS and UD solenoids are normally applied to allow transmission limp-in in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on five pressure switches to monitor fluid pressure in the L/R, 2C, 4C, UD, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The switches close at 23 psi and open at 11 psi, and simply indicate whether or not pressure exists. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

GEAR	L/R	2C	4C	UD	OD
R	OP	OP	OP	OP	OP
P/N	CL	OP	OP	OP	OP
1ST	CL*	OP	OP	CL	OP
2ND	OP	CL	OP	CL	OP
2ND PRIME	OP	OP	CL	CL	OP
D	OP	OP	OP	CL	CL
4TH	OP	OP	CL	OP	CL
5TH	OP	CL	OP	OP	CL

*L/R is closed if output speed is below 100 rpm in Drive and Manual 2. L/R is open in Manual 1.

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

REMOVAL

(1) Remove the valve body from the transmission (Fig. 119).

(2) Remove the screws holding the transmission solenoid/TRS assembly onto the valve body (Fig. 120).

(3) Separate the transmission solenoid/TRS assembly from the valve body.

TRANSMISSION SOLENOID/TRS ASSEMBLY (Continued)

**Fig. 119 Valve Body Bolts**

1 - VALVE BODY TO CASE BOLT (6)

**Fig. 120 Transmission Solenoid/TRS Assembly Screws**

1 - SOLENOID PACK BOLTS (15)

INSTALLATION

- (1) Place TRS selector plate in the PARK position.
- (2) Position the transmission solenoid/TRS assembly onto the valve body. Be sure that both alignment dowels are fully seated in the valve body and that the TRS switch contacts are properly positioned in the selector plate
- (3) Install the screws to hold the transmission solenoid/TRS assembly onto the valve body.

(4) Tighten the solenoid assembly screws adjacent to the arrows cast into the bottom of the valve body first. Tighten the screws to 5.7 N·m (50 in.lbs.).

(5) Tighten the remainder of the solenoid assembly screws to 5.7 N·m (50 in.lbs.).

(6) Install the valve body into the transmission.

TRANSMISSION TEMPERATURE SENSOR**DESCRIPTION**

The transmission temperature sensor is a thermistor that is integral to the Transmission Range Sensor (TRS).

OPERATION

The transmission temperature sensor is used by the TCM to sense the temperature of the fluid in the sump. Since fluid temperature can affect transmission shift quality and converter lock up, the TCM requires this information to determine which shift schedule to operate in.

Calculated Temperature

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

VALVE BODY**DESCRIPTION**

The valve body consists of a cast aluminum valve body, a separator plate, and a transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 121) and (Fig. 122):

- Solenoid switch valve
- Manual valve
- Low/reverse switch valve
- 5 Accumulators
- 7 check balls

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

80c072f1

Fig. 122 Check Ball Locations**SOLENOID SWITCH VALVE**

The Solenoid Switch Valve (SSV) controls the direction of the transmission fluid when the L/R-TCC solenoid is energized.

The Solenoid Switch Valve controls line pressure from the LR-TCC solenoid. In 1st gear, the SSV will be in the downshifted position, thus directing fluid to the L/R clutch circuit. In 2nd, 3rd, 4th, and fifth gears, the solenoid switch valve will be in the upshifted position and directs the fluid into the torque converter clutch (TCC) circuit.

When shifting into 1st gear, a special hydraulic sequence is performed to ensure SSV movement into the downshifted position. The L/R pressure switch is monitored to confirm SSV movement. If the movement is not confirmed (the L/R pressure switch does not close), 2nd gear is substituted for 1st. A DTC will be set after three unsuccessful attempts are made to get into 1st gear in one given key start.

VALVE BODY (Continued)

MANUAL VALVE

The manual valve is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the top of the valve body. The valve is connected mechanically by a cable to the gearshift mechanism. The valve is held in each of its positions by a roller detent spring (Fig. 123) that engages the "roostercomb" of the TRS selector plate.

80c072f3

Fig. 123 TRS Selector Plate and Detent Spring

LOW/REVERSE SWITCH VALVE

The low/reverse switch valve allows the low/reverse clutch to be operated by either the LR/CC solenoid or the MS solenoid.

REMOVAL

The valve body can be removed for service without having to remove the transmission assembly.

The valve body can be disassembled for cleaning and inspection of the individual components. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 45RFE/VALVE BODY - DISASSEMBLY)

- (1) Shift transmission into PARK.
- (2) Raise vehicle.
- (3) Disconnect wires at the solenoid and pressure switch assembly connector.
- (4) Position drain pan under transmission oil pan.
- (5) Remove transmission oil pan.

- (6) Remove the primary oil filter from valve body. (Fig. 124)

1 - SOLENOID PACK BOLTS (15)

(3) Remove the screw holding the detent spring (Fig. 127) onto the valve body.

(4) Remove the detent spring from the valve body.

(5) Remove the TRS selector plate from the valve body and the manual valve.

(6) Remove the clutch passage seals from the valve body, if necessary.

(7) Remove the screws holding the accumulator cover onto the valve body (Fig. 128).

(8) Remove the accumulator springs and pistons from the valve body. Note which accumulator piston and spring belong in each location.

(9) Place the valve body on the bench with the transfer plate upward.

NOTE: The valve body contains seven check balls. The transfer plate must be placed upward to prevent losing the check balls when the transfer plate is removed from the valve body.

(10) Remove the screws holding the valve body to the valve body transfer plate.

(11) Remove the transfer plate from the valve body. Note the location of all check balls (Fig. 129).

(12) Remove the check balls from the valve body.

(13) Remove the retainers securing the solenoid switch valve, manual valve, and the low/reverse switch valve into the valve body and remove the associated valve and spring. Tag each valve and

1 - TRS SELECTOR PLATE

2 - DETENT SPRING

3 - CLUTCH PASSAGE SEALS

spring combination with location information to aid in assembly (Fig. 130).

CLEANING

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution. (Fig. 131)

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are

heavily scored, the valve body will have to be replaced.

Inspect the valves and plugs (Fig. 132) for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a

valve body assembly unless it is damaged in handling.

Inspect all the accumulator bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the accumulator springs. The springs must be free of distortion, warpage or broken coils.

Inspect all the fluid seals on the valve body (Fig. 133). Replace any seals that are cracked, distorted, or damaged in any way. These seals pass fluid pressure directly to the clutches. Any pressure leak at these points, may cause transmission performance problems.

ASSEMBLY

(1) Lubricate valves, springs, and the housing valve bores with clean transmission fluid.

(2) Install solenoid switch valve, manual valve, and the low/reverse switch valve into the valve body.

(3) Install the retainers to hold each valve into the valve body.

(4) Install the valve body check balls into their proper locations.

(5) Position the transfer plate onto the valve body.

(6) Install the screws to hold the transfer plate to the valve body. Tighten the screws to 5.6 N·m (50 in. lbs.).

(7) Install the accumulator pistons and springs into the valve body in the location from which they were removed. Note that all accumulators except the overdrive have two springs. The overdrive accumulator piston has only one spring.

(8) Position the accumulator cover onto the valve body.

(9) Install the screws to hold the accumulator cover onto the valve body. Tighten the screws to 4.5 N·m (40 in. lbs.).

(10) Install the TRS selector plate onto the valve body and the manual valve.

(11) Install the solenoid and pressure switch assembly onto the valve body.

(12) Install the screws to hold the solenoid and pressure switch assembly onto the valve body. Tighten the screws to 5.7 N·m (50 in. lbs.). Tighten the screws adjacent to the arrows cast into the bottom of the transfer plate first.

(13) Position the detent spring onto the valve body.

(14) Install the screw to hold the detent spring onto the valve body. Tighten the screw to 4.5 N·m (40 in. lbs.).

(15) Install new clutch passage seals onto the valve body, if necessary

80b9a591

Fig. 133 Valve Body Seals

- 5 - LOW/REVERSE PASSAGE SEAL
- 6 - 2ND CLUTCH PASSAGE SEAL
- 7 - 4TH CLUTCH PASSAGE SEAL
- 8 - OVERDRIVE ACCUMULATOR (1 SPRING)

INSTALLATION

(1) Check condition of seals on valve body and the solenoid and pressure switch assembly. Replace seals if cut or worn.

(2) Place TRS selector plate in the PARK position.

(3) Place the transmission in the PARK position.

(4) Lubricate seal on the solenoid and pressure switch assembly connector with petroleum jelly.

(5) Position valve body in transmission and align the manual lever on the valve body to the pin on the transmission manual shift lever.

(6) Seat valve body in case and install one or two bolts to hold valve body in place.

(7) Tighten valve body bolts alternately and evenly to 12 N·m (105 in. lbs.) torque.

(8) Install new fluid filter on valve body. Tighten filter screws to 4.5 N·m (40 in. lbs.) torque.

(9) Connect the solenoid and pressure switch assembly connector.

(10) Install oil pan. Tighten pan bolts to 12 N·m (105 in. lbs.) torque.

(11) Lower vehicle and fill transmission with Mopar® ATF +4, type 9602, fluid.

(12) Check and adjust gearshift cable, if necessary.

TIRES/WHEELS

DIAGNOSIS AND TESTING - TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 1).

Lateral runout is the **wobble** of the tire or wheel.

J9022-4

Fig. 1 Checking Tire/Wheel/Hub Runout

- 1 - RADIAL RUNOUT
- 2 - LATERAL RUNOUT

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

METHOD 1 (RELOCATE WHEEL ON HUB)

- (1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.
- (2) Check wheel bearings and adjust if adjustable or replace if necessary.
- (3) Check the wheel mounting surface.
- (4) Relocate wheel on the mounting, two studs over from the original position.
- (5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.
- (6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

- (1) Remove tire from wheel and mount wheel on service dynamic balance machine.
- (2) Check wheel radial runout (Fig. 2) and lateral runout (Fig. 3).

TIRES/WHEELS (Continued)

• **STEEL WHEELS:** Radial runout 0.040 in., Lateral runout 0.045 in. (maximum)

• **ALUMINUM WHEELS:** Radial runout 0.030 in., Lateral runout 0.035 in. (maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

STANDARD PROCEDURES - TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find the location of the heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 4).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 5).

STANDARD PROCEDURE - MATCH MOUNTING

Tires and wheels are currently not match mounted at the factory. Match mounting is a technique used to reduce runout in the wheel/tire assembly. This means that the high spot of the tire is aligned with the low spot on the wheel rim. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the rim is identified with a label on the outside of the rim and a dot on the inside of the rim. If the outside label has been removed the tire will have to be removed to locate the dot on the inside of the rim.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Use a dial indicator to locate the high spot of the tire on the center tread rib (Fig. 6). Record the indicator reading and mark the high spot on the tire.

J9322-3

Fig. 7 First Measurement On Tire

- 1 - REFERENCE MARK
- 2 - 1ST MEASUREMENT
HIGH SPOT MARK TIRE AND RIM
- 3 - WHEEL
- 4 - VALVE STEM

(2) Break down the tire and remount it 180 degrees on the rim (Fig. 8).

(3) Measure the total runout again and mark the tire to indicate the high spot.

(4) If runout is still excessive use the following procedures.

(a) If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.

J9322-4

Fig. 8 Remount Tire 180 Degrees

- 1 - VALVE STEM
- 2 - REFERENCE MARK

(b) If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING).

(c) If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 9). This procedure will normally reduce the runout to an acceptable amount.

STANDARD PROCEDURES - TIRE ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is (Fig. 10). Other rotation methods can be used, but they will not provide all the tire longevity benefits.

TIRES/WHEELS (Continued)

Fig. 9 Remount Tire 90 Degrees In Direction of Arrow

2 - 1ST HIGH SPOT ON TIRE

Fig. 10 Tire Rotation Pattern

TIRES

DESCRIPTION - TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving

- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE), This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 11).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S**, **M & S** or **M-S** (indicating mud and snow traction) imprinted on the side wall.

J9322-6

Fig. 11 Tire Identification

TIRES (Continued)

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

DESCRIPTION - RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

DESCRIPTION - TIRE INFLATION PRESSURES

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 12).

J9222-1

Fig. 12 Under Inflation Wear

1 - THIN TIRE THREAD AREAS

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 13).

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

J9222-2

Fig. 13 Over Inflation Wear

1 - THIN TIRE THREAD AREA

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicles Owners Manual. A Certification Label on the drivers side door pillar provides the minimum tire and rim size for the vehicle. The label also list the cold inflation pressure for these tires at full load operation

Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Tire inflation pressures are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or be driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure build-up.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

DESCRIPTION - TIRE PRESSURE FOR HIGH SPEED

Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire side-wall.

TIRES (Continued)

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

DESCRIPTION - REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DIAGNOSIS AND TESTING - PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

DIAGNOSIS AND TESTING - TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 14).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

DIAGNOSIS AND TESTING - TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

J8922-5

Fig. 14 Tread Wear Indicators

- 1 - TREAD ACCEPTABLE
- 2 - TREAD UNACCEPTABLE
- 3 - WEAR INDICATOR

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 15).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 15).

DIAGNOSIS AND TESTING - TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.

STANDARD PROCEDURE - REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 16). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

RN797

Fig. 15 Tire Wear Patterns

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

SPECIFICATIONS

TIRES

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
TIRE	P225/75R16
TIRE	P245/70R16

SPARE TIRE

DESCRIPTION - SPARE / TEMPORARY TIRE

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M.P.H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

WHEELS

DESCRIPTION

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

J8922-6

Fig. 16 Tire Repair Area

1 - REPAIRABLE AREA

CLEANING

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

WHEELS (Continued)

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 17).

Fig. 17 Safety Rim

- 1 - FLANGE
- 2 - RIDGE
- 3 - WELL

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pressure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

STANDARD PROCEDURE - WHEEL REPLACEMENT

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to the proper torque specification. **Never use oil or grease on studs or nuts.**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented
- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

SPECIFICATIONS

TORQUE CHART

TORQUE SPECIFICATIONS

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Lug Nut 1/2 X 20 with 60° Cone	115-150	85-115	

STUDS

REMOVAL

CAUTION: Do not use a hammer to remove wheel studs.

- (1) Raise and support vehicle.
- (2) Remove wheel and tire assembly.
- (3) Remove brake caliper, caliper adapter and rotor, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - REMOVAL).
- (4) Remove stud from hub with Remover C-4150A (Fig. 18).

INSTALLATION

CAUTION: Do not use a hammer to remove wheel studs.

- (1) Install the new stud into the hub flange.
- (2) Install the three washers onto the stud, then install the lug nut with the flat side of the nut against the washers.
- (3) Tighten the lug nut until the stud is pulled into the hub flange. Verify that the stud is properly seated into the flange.
- (4) Remove the lug nut and washers.

Fig. 18 Wheel Stud Removal

- 1 - REMOVER
- 2 - WHEEL STUD

- (5) Install the brake rotor, caliper adapter, and caliper, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPERS - INSTALLATION).
- (6) Install the wheel and tire assembly, use new lug nut on stud or studs that were replaced.
- (7) Remove the support and lower vehicle.

BODY

DESCRIPTION - COMPONENT FASTENERS

DaimlerChrysler Corporation uses many different types of push-in fasteners to secure the interior and exterior trim to the body. Most of these fasteners can be reused to assemble the trim during various repair procedures. At times, a push-in fastener cannot be removed without damaging the fastener or the component it is holding. If it is not possible to remove a fastener without damaging a component or body, cut or break the fastener and use a new one when installing the component. Never pry or pound on a plastic or pressed-board trim component. Using a suitable fork-type prying device, pry the fastener from the retaining hole behind the component being removed. When installing, verify fastener alignment with the retaining hole by hand. Push directly on or over the fastener until it seats. Apply a low-force pull to the panel to verify that it is secure.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges holding the component in place.

DESCRIPTION - LOCK CYLINDERS

Ignition, door, deck lid, and rear hatch lock cylinders are all codable to the key. Lock barrels, tumblers, and tumbler springs are available to allow the technician to change replacement locks cylinders to match the customer's original key set. See the appropriate section in this manual for lock cylinder

removal. See the Mopar® catalogue for part numbers and lock coding procedures.

DESCRIPTION

Exterior sheet metal components make up the exterior of the vehicle. Some exterior metal systems are welded assemblies, such as doors and hoods. Some exterior trim items are made of composite.

OPERATION

The exterior is finished in various metal stampings and composite moldings. These assemblies give the vehicle a finished appearance and protect the occupants from the elements. Some components are part of the energy absorbing system used to protect the occupants in collisions. The exterior sheet metal is repairable and adjustable for fit and finish. Welded and bonded component systems are adjustable as a system. Trim components made of composite are stamped with the type of material used. DaimlerChrysler uses various fasteners to retain trim items. At times, it is not possible to remove trim items without damaging the fastener. If it is not possible to remove an item without damaging a component, cut or break the fasteners and use new ones when installing the component.

DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving

BODY (Continued)

conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations refer to Group 0, Lubrication and Maintenance, General Information section.

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

DIAGNOSIS AND TESTING - WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be

BODY (Continued)

noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

Wind noise can also be caused by improperly fitted exterior moldings or body ornamentation. Loose moldings can flutter, creating a buzzing or chattering noise. An open cavity or protruding edge can create a whistling or howling noise. Inspect the exterior of the vehicle to verify that these conditions do not exist.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURES - BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

(1) When necessary, lubricate the operating mechanisms with the specified lubricants.

(2) Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.

(3) Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.

(4) The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.

(5) The door lock cylinders should be lubricated twice each year (preferably autumn and spring).

(a) Spray a small amount of lock cylinder lubricant directly into the lock cylinder.

(b) Apply a small amount to the key and insert it into the lock cylinder.

(c) Rotate it to the locked position and then back to the unlocked position several times.

(d) Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

STANDARD PROCEDURES - DRILLING AND WELDING

When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

SPECIFICATIONS

BODY LUBRICANTS

COMPONENT	SERVICE INTERVAL	LUBRICANT
Door Hinges	As Required	Multi-Purpose Grease NLGI GC-LB (Water Resistant) (1)
Door Latches	As Required	Multi-Purpose Grease NLGI GC-LB (Water Resistant) (1)

EXTERIOR HANDLE

REMOVAL

(1) Remove the liftgate trim panel refer to (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).

(2) Remove the latch, outside handle linkage, and power lock connector.

(3) Remove the fasteners attaching the outside handle to the liftgate.

(4) Remove the outside handle from the liftgate.

INSTALLATION

(1) Position the outside handle on the liftgate.

(2) Install the fasteners attaching outside handle to liftgate.

(3) Connect outside handle link and power lock connector.

(4) Install liftgate trim panel, refer to (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

FLIP-UP GLASS

REMOVAL

CAUTION: DO NOT DISCONNECT THE PROP ROD CYLINDERS WITH THE LIFTGATE FLIP UP GLASS CLOSED. THE PROP ROD PISTONS ARE OPERATED BY HIGH PRESSURE GAS. THIS PRESSURE COULD CAUSE DAMAGE AND/OR PERSONAL INJURY IF THEY ARE REMOVED WHILE THE PISTONS ARE COMPRESSED.

(1) Using a trim stick or other suitable device, separate the flip up glass hinge cover from the hinge on the liftgate (Fig. 1).

(2) Open liftgate flip up glass. Support the glass for ease of repair.

(3) Using a small flat blade or equivalent tool, gently pry open the locking caps on the end of the prop rods.

(4) Remove prop rod cylinders from ball studs.

(5) Lower the flip up glass.

(6) Remove hinge fasteners from liftgate.

(7) Separate flip up glass from liftgate.

FLIP-UP GLASS (Continued)

**Fig. 1 Flip-Up Glass**

- 1 - FLIP-UP GLASS
- 2 - HINGE COVER
- 3 - SUPPORT PROP

- 4 - BUMPER
- 5 - BUMPER

INSTALLATION

- (1) Position flip up glass on liftgate.
- (2) Install hinge fasteners, hand tight only.
- (3) With the glass panel in the fully open position, fully raised position, push the glass forward to completely seat the hinges. Tighten hinge fasteners to 6N·m (60 in. lbs.).
- (4) Install prop rods on ball studs and compress locking caps to lock rods on ball studs.
- (5) Lower the flip up glass and install the flip up glass hinge cover.
- (6) Check the flip up glass for proper alignment and latching.

**Fig. 2 Flip-up Glass Latch**

- 1 - LATCH
- 2 - LIFTGATE

FLIP-UP GLASS LATCH**REMOVAL**

- (1) Open liftgate flip up glass.
- (2) Remove the trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
- (3) Remove latch (Fig. 2).
- (4) Disconnect switch connectors.
- (5) Remove latch from liftgate.

INSTALLATION

- (1) Position the latch on the liftgate (Fig. 2).
- (2) Connect switch connectors.
- (3) Adjust latch to the proper position, and tighten the fasteners to 11 N·m (100 in. lbs.).

FLIP-UP GLASS LATCH (Continued)

(4) Close flip up glass panel and verify proper operation.

(5) Install liftgate trim panel, refer to (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

FLIP-UP GLASS LATCH
STRIKER

REMOVAL

- (1) Raise flip up glass panel.
- (2) Mark the position of the handle/striker on the glass panel.
- (3) Remove the screws attaching the handle/striker to the glass.

INSTALLATION

- (1) Position the handle/striker on the glass panel and align the reference marks.
- (2) Install the screws attaching the handle/striker to the glass panel. Tighten the fasteners to 6 N·m (60 in. lbs.).

FLIP-UP GLASS SWITCH

REMOVAL

- (1) Remove license plate lamp housing/trim panel from liftgate, refer to (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP UNIT - REMOVAL).
- (2) Squeeze the locking tabs inward to release the switch from the housing.
- (3) Disconnect the switch harness connector, remove the switch from the housing.

INSTALLATION

- (1) Install switch harness connector.
- (2) Position switch in housing, snap switch into place.
- (3) Install license plate lamp housing/trim panel onto liftgate, refer to (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/LICENSE PLATE LAMP UNIT - INSTALLATION).

HINGE

REMOVAL

NOTE: It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

- (1) Open the liftgate. Support the liftgate for ease of repair.
- (2) Remove the liftgate header trim panel.
- (3) Mark the hinge location with a grease pencil or other suitable device.
- (4) Remove the hinge screws (Fig. 5).
- (5) Remove hinge.

INSTALLATION

NOTE: It is not necessary to remove the liftgate to replace one or both hinges. The hinges can be replaced one at a time.

- (1) Position the hinge on the roof panel and on the liftgate. (Use 3M™ Fast and Firm or equivalent on the hinge to body mating surfaces as a sealant.)
- (2) Install and tighten hinge screws at roof panel to 28N·m (21 ft. lbs.).
- (3) Install hinge screws at liftgate. Tighten screws to 28N·m (21 ft. lbs.).
- (4) Install liftgate header trim panel.
- (5) Check the liftgate for proper alignment and operation.

LATCH

REMOVAL

- (1) Raise the liftgate.
- (2) Remove the liftgate trim panel (Fig. 3).
- (3) Disconnect the power connector.
- (4) Disconnect the outside handle link from the latch.
- (5) Remove the latch screws and remove latch.

LATCH (Continued)

80b34e98

Fig. 3 Liftgate Latch

- 1 - LATCH
- 2 - LIFTGATE
- 3 - CONNECTOR
- 4 - ACTUATOR

- 5 - CLIP
- 6 - OUTSIDE HANDLE TO LATCH ROD
- 7 - OUTSIDE HANDLE

INSTALLATION

- (1) Install the latch into the liftgate and tighten the screws to 7N·m (5 ft. lbs.).
- (2) Connect the outside handle to the liftgate latch.
- (3) Plug in the connector for the power .
- (4) Install the liftgate trim panel.

LATCH STRIKER**REMOVAL**

- (1) Raise liftgate.
- (2) Remove tail lamp, refer to (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - REMOVAL).
- (3) Remove nuts attaching striker to D-pillar (Fig. 4).
- (4) Separate striker from D-pillar.

80b3c70e

Fig. 4 Liftgate Latch Striker

- 1 - D-PILLAR
- 2 - STRIKER

INSTALLATION

- (1) Position striker on D-pillar.
- (2) Install nuts attaching striker to D-pillar. Tighten nuts to 10 N·m (7 ft. lbs.) torque (Fig. 4).

- (3) Install tail lamp (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - INSTALLATION).

LIFTGATE

REMOVAL

CAUTION: DO NOT DISCONNECT THE SUPPORT ROD CYLINDERS WITH THE LIFTGATE CLOSED. THE SUPPORT ROD PISTONS ARE OPERATED BY HIGH PRESSURE GAS. THIS PRESSURE COULD CAUSE DAMAGE AND /OR PERSONAL INJURY IF THEY ARE REMOVED WHILE THE PISTONS ARE COMPRESSED.

- (1) Open the liftgate. Support the liftgate for ease of repair.
- (2) Remove the liftgate trim panel.
- (3) Remove the prop rods from the liftgate.
- (4) Unplug the wire harnesses and disconnect the washer hose.
- (5) Mark the hinge location with a wax pencil or other suitable device (Fig. 5).
- (6) Remove the hinge screws and remove liftgate from vehicle.

Fig. 5 Liftgate

- 1 - HINGE
2 - LIFTGATE

INSTALLATION

- (1) Position the liftgate on the vehicle and align the witness marks.
- (2) Install the hinge screws at liftgate. Tighten hinge screws to 28N·m (21ft. lbs.).
- (3) Connect the wire harnesses and the washer hose.
- (4) Install the trim panel.
- (5) Install the prop rods.
- (6) Close the liftgate and check for proper latching and alignment.

LIFTGATE ADJUSTMENT

The position of the liftgate can be adjusted upward or downward by the use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use 3M[®] Fast and Firm or equivalent on the hinge to body mating surface as a sealant.

TRIM PANEL

REMOVAL - LIFTGATE TRIM PANEL

NOTE: The liftgate trim panel is attached with screws and spring clips.

- (1) Raise the liftgate.
- (2) Remove the screws securing the liftgate trim panel to the liftgate (Fig. 6).
- (3) Disconnect the rear window defroster wires.
- (4) Using a trim stick, or other suitable tool, pry the liftgate trim panel off the liftgate.

Fig. 6 Liftgate Trim Panel

- 1 - LIFTGATE
2 - LIFTGATE TRIM PANEL

80ba7980

TRIM PANEL (Continued)

REMOVAL - LOWER LIFTGATE OPENING TRIM PANEL

- (1) Remove screws at outboard end of lower liftgate trim panel.
- (2) Open the spare tire cover and remove the screws near the center of the lower liftgate trim panel (Fig. 7).
- (3) Remove the lower liftgate trim panel.

80ba7979

Fig. 7 Liftgate Opening Trim Panel

- 1 - UPPER LIFTGATE OPENING TRIM PANEL
2 - LOWER LIFTGATE OPENING TRIM PANEL

INSTALLATION - LIFTGATE TRIM PANEL

NOTE: The liftgate trim panel is attached with screws and spring clips.

- (1) Align the liftgate trim panel spring clips and press the panel into the liftgate.
- (2) Install the trim panel screws.
- (3) Connect the rear defroster wires.

INSTALLATION - LOWER LIFTGATE OPENING TRIM PANEL

- (1) Align the screw holes and locators to the holes in the liftgate opening.
- (2) Install the screws in the liftgate opening trim panel.
- (3) Install the spare tire cover.

LIFTGATE INSULATOR**REMOVAL**

- (1) Remove the liftgate trim panel, refer to (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
- (2) Separate the liftgate insulator from the liftgate and trim panel (Fig. 8).

80b46b0d

Fig. 8 Liftgate Insulator Pad

- 1 - LIFTGATE
2 - INSULATION PAD

INSTALLATION

- (1) Thoroughly clean the area of any adhesive or insulation material.
- (2) Install the insulator in the liftgate.
- (3) Install the liftgate trim panel refer to (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

CHECK STRAP

REMOVAL

- (1) Remove the waterdam, refer to (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (2) Remove speaker.
- (3) Remove screws attaching door check to A-pillar.
- (4) Remove nuts attaching door check to door (Fig. 1).
- (5) Remove door check through speaker location hole.

INSTALLATION

- (1) Position door check on door through speaker location hole (Fig. 1).
- (2) Install nuts attaching door check to door.
- (3) Install screws attaching door check to A-pillar.
- (4) Install speaker.
- (5) Install the waterdam, refer to (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

80b3c6ef

Fig. 1 Door Check

- 1 - DOOR CHECK
- 2 - FRONT DOOR

DOOR

REMOVAL

- (1) Disconnect front door harness connector (Fig. 2).
- (2) Support door with padded floor jack.
- (3) Remove retaining clips from hinge pins.
- (4) Tap out hinge pins.
- (5) Separate door from vehicle.

Fig. 2 Front Door Harness Connector

- 1 - HARNESS CONNECTOR
2 - DOOR

INSTALLATION

- (1) Position door at vehicle and align hinges.
- (2) Install hinge pins.
- (3) Install retaining clips for hinge pins.
- (4) Connect front door harness connector (Fig. 2).

DOOR ADJUSTMENT

Minor adjustment for alignment of the door is made by moving the latch striker.

IN AND OUT

- (1) Loosen the latch striker.
- (2) Tap the latch striker inward if the door character line is outboard of the body character line or tap the latch striker outward if the door character line is inboard of the body character line.
- (3) Inspect the alignment. If correct, tighten striker to 28 N·m (21 ft. lbs.) .

UP AND DOWN

- (1) Loosen the latch striker.
- (2) Tap the latch striker downward if the door character line is higher than the body character line or tap the latch striker upward if the door character line is lower than the body character line.
- (3) Inspect the alignment. If correct, tighten to 28 N·m (21 ft. lbs.).

DOOR GLASS

REMOVAL

- (1) Locate glass to full down position.
- (2) Remove the waterdam, refer to (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).
- (3) Remove inner belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL).
- (4) Remove outer belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - REMOVAL).
- (5) Locate glass to 3/4 up position.
- (6) Using a long flat blade or hook type tool, disengage clips (Fig. 3) attaching glass retainer to glass lift plate.
- (7) Carefully push bottom of glass panel outward to disengage glass retainer studs from lift plate (Fig. 4).
- (8) Lift glass upward and out of door.

Fig. 3 Front Door Glass Clips

- 1 - GLASS
2 - RETAINER
3 - CLIP
4 - LIFT PLATE
5 - REGULATOR
6 - CLIP

INSTALLATION

- (1) Lower glass into position.
- (2) Carefully align glass retainer studs with lift plate and insert studs into lift plate.
- (3) Engage clips attaching glass retainer to glass lift plate.
- (4) Locate glass to full down position.
- (5) Install outer belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - INSTALLATION).

DOOR GLASS (Continued)

**Fig. 4 Front Door Glass Retainer**

- 1 - GLASS
- 2 - RETAINER
- 3 - LIFT PLATE
- 4 - STUD

(6) Install inner belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION).

(7) Install waterdam, refer to (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

EXTERIOR HANDLE

REMOVAL

(1) Remove glass run channel, refer to (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - REMOVAL).

(2) Disconnect lock cylinder to latch rod.

(3) Disconnect outside handle to latch rod

(4) Remove fasteners attaching outside handle to door (Fig. 5).

(5) Remove outside handle from door.

(6) Disconnect anti-theft harness connector, if equipped.

(7) Separate outside handle from vehicle.

INSTALLATION

(1) Position outside handle at door (Fig. 5).

(2) Connect anti-theft harness connector, if equipped.

(3) Position outside handle in door.

(4) Install fasteners attaching outside handle to door.

(5) Connect outside handle to latch rod

(6) Connect lock cylinder to latch rod.

(7) Install glass run channel, refer to (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION).

**Fig. 5 Front Door Outside Handle**

- 1 - DOOR
- 2 - OUTSIDE HANDLE

GLASS RUN CHANNEL

REMOVAL

NOTE: Only the rearward glass run channel is serviceable.

(1) Remove the waterdam, refer to (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - REMOVAL).

(2) Remove inner belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - REMOVAL).

(3) Remove outer belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - REMOVAL).

(4) Remove bolt attaching run channel to inner door panel (Fig. 6).

(5) Peel back glass run channel weatherstrip on rear run channel.

(6) Pull glass run channel downward to separate from door.

(7) Remove glass run channel from door.

INSTALLATION

(1) Position glass run channel in door (Fig. 6).

(2) Align glass run channel with door frame run channel and slide channel upward to secure door.

(3) Press glass run channel weatherstrip into rear run channel.

GLASS RUN CHANNEL (Continued)

**Fig. 6 Front Door Glass Run Channel**

- 1 - DOOR
- 2 - GLASS
- 3 - GLASS RUN CHANNEL
- 4 - REGULATOR

(4) Install bolt attaching run channel to inner door panel.

(5) Install outer belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR OUTER BELT WEATHERSTRIP - INSTALLATION).

(6) Install inner belt weatherstrip, (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FDR INNER BELT WEATHERSTRIP - INSTALLATION).

(7) Install the waterdam, (Refer to 23 - BODY/DOOR - FRONT/WATERDAM - INSTALLATION).

HINGE

REMOVAL

- (1) Open and support door.
- (2) Using a wax pencil, or other suitable device, reference mark the hinge placement
- (3) Disconnect the door wire harness.
- (4) Remove the door check from the "A" pillar (Fig. 7).
- (5) Remove the fasteners retaining the door hinge to the door (Fig. 8).
- (6) Remove the door.
- (7) Remove the hinge from the "A" pillar.

INSTALLATION

- (1) Position hinge on "A" pillar. (Use 3M® Fast and Firm or equivalent on the hinge to body mating surface as a sealant.)
- (2) Install hinge to body bolts, but do not tighten.
- (3) Align the hinge to the reference marks and torque the bolts to 35N·m (26 ft. lbs.).
- (4) Install the door on the hinge and align with the reference marks.

**Fig. 7 Front Door Check**

- 1 - DOOR CHECK
- 2 - FRONT DOOR

**Fig. 8 Front Door Hinges**

- 1 - WASHER
- 2 - UPPER HINGE
- 3 - FRONT DOOR
- 4 - LOWER HINGE
- 5 - WASHER

- (5) Tighten the door to hinge fasteners.
- (6) For adjustment see door adjustment procedure.

INSIDE HANDLE ACTUATOR

REMOVAL

- (1) Remove door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Disconnect latch and lock rods from inside handle actuator.
- (3) Remove screws attaching inside handle actuator to trim panel (Fig. 9).
- (4) Separate inside handle actuator from trim panel.

Fig. 9 Front Door Inside Handle Actuator

- 1 - INSIDE HANDLE ACTUATOR
2 - DRIVER'S DOOR TRIM PANEL
3 - SCREW

INSTALLATION

- (1) Position inside handle actuator in trim panel.
- (2) Install screws attaching inside handle actuator to trim panel (Fig. 9).
- (3) Connect latch and lock rods to inside handle actuator.
- (4) Install door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

LATCH

REMOVAL

- (1) Remove glass run channel, refer to (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - REMOVAL).
- (2) Remove screws attaching door latch to door (Fig. 10).

- (3) Disconnect all rods from door latch.
- (4) Disconnect wire harness connector, if equipped.
- (5) Separate door latch from door.

Fig. 10 Door Latch

- 1 - DOOR
2 - LATCH
3 - ISOLATOR

INSTALLATION

- (1) Position door latch at door.
- (2) Connect wire harness connector, if equipped.
- (3) Connect all rods to door latch.
- (4) Install screws attaching door latch to door. Tighten screws to 10 N·m (7 ft. lbs.) torque (Fig. 10).
- (5) Install glass run channel, refer to (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION).

ADJUSTMENT

DOOR LATCH ADJUSTMENT

- (1) Locate access hole (Fig. 11).
- (2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
- (3) Operate outside handle button several times to release any restriction because of mis-alignment.
- (4) Tighten adjustment screw to 3 N·m (30 in-lbs) torque.
- (5) Test handle button and lock cylinder for proper operation.

LATCH (Continued)

**Fig. 11 Door Latch Adjustment**

- 1 - ACCESS HOLE
- 2 - DOOR
- 3 - LATCH MOUNTING BOLTS
- 4 - LATCH

LATCH STRIKER

REMOVAL

- (1) Remove screws attaching striker to B-pillar.
- (2) Separate striker and spacer from B-pillar (Fig. 12).

**Fig. 12 Front Door Latch Striker**

- 1 - B-PILLAR
- 2 - SPACER
- 3 - STRIKER

INSTALLATION

- (1) Position striker and spacer on B-pillar.
- (2) Install screws attaching striker to B-pillar. Tighten screws to 28 N·m (20 ft. lbs.) torque (Fig. 12).

LOCK CYLINDER

REMOVAL

- (1) Remove outside door handle, refer to (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).
- (2) Remove screw securing lock cylinder retainer to outside door handle (Fig. 13).
- (3) Separate lock cylinder from door handle.
- (4) Disconnect lock cylinder switch, if equipped.

**Fig. 13 Front Door Lock Cylinder**

- 1 - OUTSIDE DOOR HANDLE
- 2 - LOCK CYLINDER
- 3 - ANTI-THEFT SWITCH
- 4 - RETAINER

INSTALLATION

- (1) Connect lock cylinder switch, if equipped.
- (2) Position lock cylinder in door handle.
- (3) Position lock cylinder retainer and install screw (Fig. 13).
- (4) Install outside door handle, refer to (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

TRIM PANEL

REMOVAL

- (1) Remove trim plug from mirror flag bezel.
- (2) Remove screws attaching trim panel to door (Fig. 14).
- (3) Using trim remover (C-4829 or equivalent), detach trim panel perimeter push-in fasteners from door inner panel.
- (4) Lift trim panel upward and separate from door.
- (5) If equipped, disconnect harness connectors for power accessories.

TRIM PANEL (Continued)

- (6) Disconnect latch rods from inside handle actuator.
- (7) Separate trim panel from vehicle.

**Fig. 14 Front Door Trim Panel**

- 1 - HARNESS CONNECTOR
- 2 - NUTSERT
- 3 - TRIM PLUG
- 4 - TRIM PANEL
- 5 - PUSH-IN FASTENER
- 6 - HARNESS CONNECTOR
- 7 - LATCH RODS

INSTALLATION

- (1) Connect latch rods to inside handle actuator.
- (2) If equipped, connect harness connectors to power accessories.
- (3) Position trim panel on door inner panel.
- (4) Press trim panel push-in fasteners inward around perimeter of door.
- (5) Install screws attaching trim panel to door (Fig. 14).
- (6) Install trim plug in mirror flag bezel.

WATERDAM**REMOVAL**

- (1) Remove door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Peel the waterdam from door.
- (3) Route all harnesses and linkage rods through waterdam as necessary.
- (4) Separate waterdam from door (Fig. 15).

**Fig. 15 Front Door Waterdam**

- 1 - INSULATOR PAD

INSTALLATION

- (1) Waterdam contact surface must be free of contaminants. Clean as necessary.
- (2) Route all harnesses and linkage rods through waterdam as necessary.
- (3) Position waterdam on door and align all holes.
- (4) Press waterdam on door (Fig. 15).
- (5) Install door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

WINDOW REGULATOR

REMOVAL

- (1) Remove front door glass, refer to (Refer to 23 - BODY/DOOR - FRONT/DOOR GLASS - REMOVAL).
- (2) Loosen bolts attaching regulator to inner door panel (Fig. 16).
- (3) Remove bolt attaching regulator to inner door panel (Fig. 17).
- (4) Lift regulator upward to disengage bolts from door inner panel.
- (5) Disengage power window regulator harness connector, if equipped.
- (6) Remove regulator through access hole in door.

Fig. 16 Front Door Regulator Bolts

- 1 - FRONT DOOR
- 2 - REMOVE BOLT
- 3 - LOOSEN BOLTS

Fig. 17 Front Door Window Regulator

- 1 - FRONT DOOR
- 2 - REGULATOR

INSTALLATION

- (1) Position regulator in door through access hole.
- (2) Engage power window regulator harness connector, if equipped.
- (3) Lift regulator upward and engage bolts in door inner panel key hole slots.
- (4) Install bolt attaching regulator to inner door panel.
- (5) Tighten bolts attaching regulator to inner door panel.
- (6) Install front door glass, refer to (Refer to 23 - BODY/DOOR - FRONT/GLASS RUN CHANNEL - INSTALLATION).

CHECK STRAP

REMOVAL

- (1) Remove waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Remove speaker.
- (3) Remove screws attaching door check to B-pillar.
- (4) Remove nuts attaching door check to door (Fig. 1).
- (5) Remove door check through speaker location hole.

INSTALLATION

- (1) Position door check on door through speaker location hole.
- (2) Install nuts attaching door check to door (Fig. 1).
- (3) Install screws attaching door check to B-pillar.
- (4) Install speaker.
- (5) Install waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).

Fig. 1 Door Check

- 1 - DOOR CHECK
- 2 - REAR DOOR

DOOR

REMOVAL

- (1) Disconnect rear door harness connector (Fig. 2).
- (2) Support door with padded floor jack.
- (3) Remove retaining clips from hinge pins.
- (4) Tap out hinge pins.
- (5) Separate door from vehicle.

Fig. 2 Rear Door Harness Connector

1 - HARNESS CONNECTOR

INSTALLATION

- (1) Position door at vehicle and align hinges.
- (2) Install hinge pins.
- (3) Install retaining clips for hinge pins.
- (4) Connect rear door harness connector (Fig. 2).

DOOR GLASS

REMOVAL

- (1) Remove waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Remove inner belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/RDR INNER BELT WEATHERSTRIP - REMOVAL).
- (3) Remove stationary glass, refer to (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - REMOVAL).
- (4) Disengage clips attaching window glass to lift plate.
- (5) Press studs out of lift plate.
- (6) Lift window glass from door (Fig. 3).

80b46b1f

Fig. 3 Glass Channel

1 - GLASS
2 - REGULATOR

INSTALLATION

- (1) Position window glass in door (Fig. 3).
- (2) Engage studs into lift plate.
- (3) Engage clips attaching window glass to lift plate.
- (4) Install stationary glass, refer to (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - INSTALLATION).
- (5) Install inner belt weatherstrip, refer to (Refer to 23 - BODY/WEATHERSTRIP/SEALS/RDR INNER BELT WEATHERSTRIP - INSTALLATION).
- (6) Install waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).

EXTERIOR HANDLE

REMOVAL

- (1) Remove waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Locate glass to full up position.
- (3) Disconnect lock knob to latch rod.
- (4) Disconnect outside handle to latch rod.
- (5) Remove fasteners attaching outside handle to door (Fig. 4).
- (6) Remove outside handle from door.
- (7) Separate outside handle from vehicle.

EXTERIOR HANDLE (Continued)

Fig. 4 Front

- 1 - DOOR
- 2 - OUTSIDE HANDLE

INSTALLATION

- (1) Position outside handle in door.
- (2) Install fasteners attaching outside handle to door (Fig. 4).
- (3) Connect outside handle to latch rod.
- (4) Connect lock knob to latch rod.
- (5) Locate glass to full down position.
- (6) Install waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).

HINGE

REMOVAL

- (1) Open front door and rear door.
- (2) Reference mark hinges for installation (Fig. 5).
- (3) Support rear door for removal of hinges.
- (4) Remove B pillar trim.
- (5) Remove nuts holding door to hinge.
- (6) Remove door.
- (7) Remove bolts holding hinge to B pillar.

INSTALLATION

- (1) Install hinge on B pillar and align reference marks (Fig. 5).
- (2) Install bolts holding hinge to B pillar. Tighten bolts to 35N-m (23 ft. lbs.).
- (3) Install door on hinge and align reference marks. Install bolts and tighten to 35N-m (26 ft. lbs.).

Fig. 5 Rear Door Hinge

- 1 - UPPER HINGE
- 2 - WASHER
- 3 - WASHER
- 4 - LOWER HINGE
- 5 - REAR DOOR

- (4) Check door for fit and ease of operation. Adjust as necessary, refer to (Refer to 23 - BODY/DOOR - FRONT/DOOR - ADJUSTMENTS).

- (5) Install B pillar trim.

INSIDE HANDLE ACTUATOR

REMOVAL

- (1) Remove door trim panel, refer to (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Disconnect latch and lock rods from inside handle actuator.
- (3) Remove screws attaching inside handle actuator to trim panel (Fig. 6).
- (4) Separate inside handle actuator from trim panel.

INSTALLATION

- (1) Position inside handle actuator in trim panel.
- (2) Install screws attaching inside handle actuator to trim panel (Fig. 6).
- (3) Connect latch and lock rods to inside handle actuator.
- (4) Install door trim panel, refer to (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

INSIDE HANDLE ACTUATOR (Continued)

**Fig. 6 Rear Door Inside Handle Actuator**

- 1 - REAR DOOR TRIM PANEL
2 - SCREW
3 - INSIDE HANDLE ACTUATOR

LATCH

REMOVAL

- (1) Remove waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Remove screws attaching latch to door (Fig. 7).
- (3) Disconnect rods from door latch.
- (4) Separate door latch from door.

**Fig. 7 Rear Door Latch**

- 1 - DOOR
2 - LATCH
3 - OUTSIDE HANDLE

INSTALLATION

- (1) position latch in door.
- (2) Connect rods to door latch.
- (3) Install screws attaching latch to door. Tighten screws to 10 N·m (95 in. lbs.) torque (Fig. 7).
- (4) Install waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).

LATCH STRIKER

REMOVAL

- (1) Remove screws attaching striker to C-pillar (Fig. 8).
- (2) Separate striker and spacer from vehicle.

**Fig. 8 Rear Door Latch Striker**

- 1 - TAPPING PLATE
2 - SPACER
3 - STRIKER

INSTALLATION

- (1) Position striker and spacer on C-pillar.
- (2) Install screws. Tighten to 28 N·m (250 in. lbs.) torque.

TRIM PANEL

REMOVAL

- (1) Remove screws attaching trim panel to door (Fig. 9).
- (2) Using trim remover (C-4829 or equivalent), detach trim panel perimeter push-in fasteners from door inner panel.
- (3) Lift trim panel upward and separate from door.
- (4) If equipped, disconnect harness connectors for power accessories.
- (5) Disconnect latch rods from inside handle actuator.
- (6) Separate trim panel from vehicle.

Fig. 9 Rear Door Trim Panel

- 1 - TRIM PANEL
2 - NUTSERT
3 - HARNESS CONNECTOR
4 - LATCH RODS

INSTALLATION

- (1) Connect latch rods to inside handle actuator.
- (2) If equipped, connect harness connectors to power accessories.
- (3) Position trim panel on door inner panel.
- (4) Press trim panel push-in fasteners inward around perimeter of door.
- (5) Install screws attaching trim panel to door (Fig. 9).

WATERDAM

REMOVAL

- (1) Remove door trim panel, refer to (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Peel the waterdam from door.
- (3) Route all harnesses and linkage rods through waterdam as necessary.
- (4) Separate waterdam from door (Fig. 10).

80b46b0f

Fig. 10 Rear Door Waterdam

1 - INSULATOR PAD

INSTALLATION

- (1) Waterdam contact surface must be free of contaminants. Clean as necessary.
- (2) Route all harnesses and linkage rods through waterdam as necessary.
- (3) Position waterdam on door and align all holes (Fig. 10).
- (4) Press waterdam on door.
- (5) Install door trim panel, refer to (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

WINDOW REGULATOR

REMOVAL

- (1) Remove waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - REMOVAL).
- (2) Remove the stationary glass, refer to (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - REMOVAL).
- (3) Raise the door glass and support.
- (4) Disconnect the speaker harness and power window harness, if equipped.
- (5) Remove the window clips retaining regulator (Fig. 11).
- (6) Remove the door glass.
- (7) Remove the fasteners retaining the regulator (Fig. 12).
- (8) Remove the regulator.

- 4 - LIFT PLATE
- 5 - REGULATOR
- 6 - CLIP

80b3c6f8

Fig. 12 Rear Door Window Regulator

- 1 - DOOR
- 2 - REGULATOR

INSTALLATION

- (1) Position the window regulator in the door.
- (2) Install the fasteners retaining the regulator (Fig. 12).
- (3) Install the door glass.
- (4) Install the window clips retaining regulator (Fig. 11).
- (5) Lower the door glass.
- (6) Install the stationary glass, refer to (Refer to 23 - BODY/STATIONARY GLASS/DOOR GLASS - INSTALLATION).
- (7) Connect the power window and speaker harness if equipped.
- (8) Install the waterdam, refer to (Refer to 23 - BODY/DOORS - REAR/WATERDAM - INSTALLATION).
- (9) Cycle the glass and check for proper operation.

BODY SIDE MOLDINGS

REMOVAL—FRONT DOOR

- (1) Open the front door.
- (2) Using a trim stick, pry the upper rear edge off the door. Continue to the front edge of the front door (Fig. 1).
- (3) Using a heat gun, warm the adhesive tape on the lower edge of the cladding and pull the cladding from the door.

REMOVAL—REAR DOOR

- (1) Open the rear door.
- (2) Using a trim stick, pry the upper rear edge off the door. Continue towards the front edge of the rear door (Fig. 2).
- (3) Using a heat gun, warm the adhesive tape on the bottom of the cladding and remove the cladding.

REMOVAL—FENDER/QUARTER PANEL

- (1) Remove the screws at wheel opening (Fig. 3).
- (2) Using a trim stick, gently pry bottom of cladding up.
- (3) Lift upwards and remove cladding.

Fig. 1 Front Door Cladding

1 - CLADDING

BODY SIDE MOLDINGS (Continued)

80b46b61

Fig. 3 Front Fender/ Quarter Panel

- 1 - SCREW
- 2 - QUARTER PANEL CLADDING
- 3 - FRONT FENDER CLADDING
- 4 - SCREW

INSTALLATION-FRONT DOOR

(1) Clean the area thoroughly with Mopar Super Kleen, or equivalent.

(2) Align the body side cladding with the slots in the door. Press the adhesive pad to the door and snap the retainers into the slots.

INSTALLATION-REAR DOOR

(1) Clean the area thoroughly with Mopar Super Kleen, or equivalent.

(2) Align the body side cladding with the slots in the door. Press the adhesive pad to the door and snap the retainers into the slots.

INSTALLATION-FENDER/QUARTER PANEL

(1) Thoroughly clean the area with Mopar Super Kleen or equivalent.

(2) Align the cladding with the screw holes in the fender.

(3) Press the cladding in place.

(4) Install the screws at the wheel opening.

COWL GRILLE**REMOVAL**

(1) Remove wiper arms, refer to (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

(2) Remove plenum seal.

(3) Remove plastic push nuts attaching cowl cover to cowl (Fig. 4).

(4) Remove windshield washer tubes at connector.

(5) Remove cowl cover from cowl.

80b46ae1

Fig. 4 Cowl Cover

- 1 - PLASTIC NUT
- 2 - COWL COVER

INSTALLATION

(1) Position cowl cover on cowl.

(2) Install windshield washer tubes at connector.

(3) Install plastic push nuts attaching cowl cover to cowl (Fig. 4).

(4) Install plenum seal.

(5) Install windshield wiper arms, refer to (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

D-PILLAR APPLIQUE

REMOVAL

(1) Using a trim stick, carefully pry applique from panel (Fig. 5).

80b46ae0

Fig. 5 D-Pillar Applique & Air Exhauster

- 1 - D-PILLAR EXHAUSTER
- 2 - D-PILLAR APPLIQUE
- 3 - CLIP
- 4 - TAIL LAMP EXHAUSTER

INSTALLATION

(1) Position applique on panel with retainers aligned.
(2) Press applique firmly in place.

D-PILLAR AIR EXHAUSTER

REMOVAL

(1) Remove D-pillar applique, refer to (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - REMOVAL).
(2) Carefully pry air exhauster from D-pillar using a flat blade screwdriver (Fig. 5).

INSTALLATION

(1) Reseal air exhauster using foam tape.
(2) Install air exhauster on D-pillar.
(3) Install D-pillar applique, refer to (Refer to 23 - BODY/EXTERIOR/COWL GRILLE SCREEN - INSTALLATION).

AIR EXHAUSTER

REMOVAL

(1) Remove tail lamp, refer to (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - REMOVAL).
(2) Using a trim stick, pry the top of the air exhauster downward to detach the retaining clips.
(3) Separate air exhauster from vehicle (Fig. 5).

INSTALLATION

(1) Position air exhauster in opening.
(2) Press air exhauster inward to secure.
(3) Install tail lamp, refer to (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/TAIL LAMP - INSTALLATION).

EXTERIOR NAME PLATES

REMOVAL

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

(1) Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.
(2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.
(3) Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.
(4) Clean adhesive residue from body with MOPAR Super Clean solvent or equivalent.

INSTALLATION

(1) Remove protective cover from adhesive tape on back of emblem.
(2) Position emblem properly on body (Fig. 6).
(3) Press emblem firmly to body with palm of hand.
(4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

EXTERIOR NAME PLATES (Continued)

80b34e9b

Fig. 6 Exterior Nameplates**FRONT FENDER****REMOVAL**

- (1) Using a wax crayon or equivalent, mark position of fender.
- (2) Remove front fender liner.
- (3) Pull back fascia and remove screws attaching fender to fascia.
- (4) Remove screws attaching lower fender bracket located behind fascia.
- (5) Remove screws attaching fender to rocker panel (Fig. 7).
- (6) Remove screws attaching rear of fender to A-pillar brackets.
- (7) Open hood.
- (8) Loosen screw under hood hinge, attaching fender to engine compartment rail .

- (9) Remove screws attaching fender to engine compartment rail (Fig. 8).

- (10) Right fender only:

- (a) If equipped, remove radio antenna.

- (11) Separate fender from body.

INSTALLATION

- (1) Position fender on body.
- (2) Right fender only:
 - (a) If equipped, install radio antenna.
- (3) Install all screws finger-tight.
- (4) Align fender with adjacent body panels and wax crayon reference marks.
- (5) Tighten all screws.
- (6) Install inner fender liner.

FRONT FENDER (Continued)

GRILLE

REMOVAL

- (1) Remove fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (2) Disengage retainers attaching grille insert to grille/fascia.
- (3) Separate grille insert from grille/fascia (Fig. 10).

80b6b1f5

Fig. 10 Grille Insert

1 - GRILLE/FASCIA
2 - INSERT

INSTALLATION

- (1) Position grille insert in grille/fascia (Fig. 10).
- (2) Engage retainers attaching grille insert to grille/fascia.
- (3) Install fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

HEADLAMP MOUNTING MODULE

REMOVAL

CAUTION: Take special care when handling the HMM not to damage the upper mounting tabs. Step #3 must be performed prior to removing HMM from the vehicle to prevent damage to HMM.

- (1) Remove fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
- (2) Remove inner fender liner.
- (3) Reach into the wheelhouse opening and disengage the retainer attaching the HMM to each side of the body.
- (4) Remove bolts attaching headlamp mounting module to body (Fig. 11).
- (5) Disconnect headlamp wire harness connectors.
- (6) Separate headlamp mounting module from vehicle.

INSTALLATION

- (1) Position headlamp mounting module at vehicle.
- (2) Connect headlamp wire harness connectors.
- (3) Engage the retainer attaching the HMM to each side of the body.
- (4) Install bolts attaching headlamp mounting module to body (Fig. 11).
- (5) Install inner fender liner.
- (6) Install front fascia, refer to (Refer to 13 - FRAMES & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).

LUGGAGE RACK

REMOVAL

NOTE: The skid strips are attached to the roof panel with adhesive.

- (1) Using a trim stick, or other suitable device, pry support cover off.
- (2) If necessary, slide the crossbars to expose the screws attaching the slide rails to the supports.
- (3) Remove the screws retaining the slide rails to the supports.
- (4) Remove the screws attaching the supports to the roof panel.
- (5) Separate the supports from the roof panel.

NOTE: If a crossbar needs to be serviced, the forward or rearward supports will have to be removed.

INSTALLATION

- (1) Position the supports on the roof panel and install the screw. Be sure that the gasket is properly seated.
- (2) Position the luggage rack on the supports.
- (3) Install the screws attaching the side rails to the supports.
- (4) Position the supports covers on the supports and press into place.

SIDE VIEW MIRROR GLASS

REMOVAL

- (1) With damaged mirror still on vehicle, position mirror glass down and centered.
- (2) Position a wide leverage device between the bottom edge of the glass and the mirror shell.
- (3) Firmly apply pressure in an upward direction until glass assembly disengages from adapter plate.
- (4) Disconnect the heater wire terminal, if equipped, or the EC plug, if equipped.

SIDE VIEW MIRROR GLASS (Continued)

INSTALLATION

(1) Connect the heater wire terminal or the EC plug, if equipped.

(2) Position the replacement glass in the mirror shell and align the four snap tabs with the four cavities in the shell.

(3) Apply firm pressure inward until the replacement glass assembly engages with the adapter plate. Correct assembly will result in a firm click. Glass assembly should exhibit even gaps to the shell when complete.

(4) Pull lightly on corners of glass assembly to ensure all four snaps are engaged and there is no free play.

Fig. 12 Side View Mirror

- 1 - SIDEVIEW MIRROR
- 2 - MIRROR FLAG SEAL
- 3 - CONNECTOR

SIDE VIEW MIRROR**REMOVAL**

(1) Remove door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

(2) Disengage power mirror harness connector, if equipped.

(3) Remove mirror flag seal.

(4) Remove nuts attaching mirror to door (Fig. 12).

(5) Separate mirror from door.

INSTALLATION

(1) Position mirror on door. Verify that gasket seal is properly positioned.

- (2) Install nuts attaching mirror to door (Fig. 12).
- (3) Install mirror retaining nuts.
- (4) Install mirror flag seal.
- (5) Engage power mirror harness connector, if equipped.
- (6) Install door trim panel, refer to (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

GAS PROP

REMOVAL

- (1) Raise and support hood.
- (2) Using a small flat blade, pry the retainer attaching hood support prop to lower ball stud.
- (3) Slide retainer attaching hood support prop upper ball stud downward.
- (4) Disconnect hood support prop from lower ball stud and rotate support prop upward and disconnect from upper ball stud (Fig. 1).

80b3c6fc

Fig. 1 Hood Support Prop

- 1 - HOOD
- 2 - COVER
- 3 - HINGE
- 4 - PROP

INSTALLATION

- (1) Position hood support prop on upper ball stud (Fig. 1).
- (2) Slide retainer upward to secure support prop to upper ball stud.

- (3) Position support prop on lower ball stud and press retainer inward to secure.

HINGE

REMOVAL

- (1) Raise and support hood.
- (2) Using a wax crayon or equivalent, mark position of hinge.
- (3) Remove hood hinge prop rod.
- (4) Remove nuts attaching hinge to hood (Fig. 1).
- (5) Remove bolts attaching hinge to body.
- (6) Separate hinge from vehicle.

INSTALLATION

- (1) Position hinge on vehicle and align reference marks.
- (2) Install bolts attaching hinge to body.
- (3) Install nuts attaching hinge to hood.
- (4) Install hood hinge prop rod.

HOOD

REMOVAL

- (1) Raise hood.
- (2) If equipped, disconnect underhood lamp harness connector. (Connector is located under cowl cover).
- (3) Using a wax crayon or equivalent, mark location of hood hinges on hood for installation alignment.
- (4) Support hood in the open position.
- (5) Remove hood support prop rods.
- (6) Remove bolts attaching hinges to hood.
- (7) With the aid of a helper, remove hood from vehicle.

HOOD (Continued)

INSTALLATION

- (1) Position hood on hinges.
- (2) Install bolts finger-tight.
- (3) Align hinges with installation reference marks and tighten bolts.
- (4) Install hood support prop rods.
- (5) Connect underhood lamp connector.
- (6) Inspect hood for proper alignment and adjust as necessary.

HOOD ADJUSTMENT

The hood attaching holes are enlarged to aid front, back and side to side adjustment.

- (1) If hood is low in relation to cowl panel, insert shims between hinge and hood.
- (2) Adjust hood bumper in or out to adjust hood-to-fender height alignment.
- (3) Adjust the hood latch as necessary. Tighten the nuts to 11N·m (8 ft. lbs.).
- (4) Align the latch striker so that striker enters the latch squarely and without binding.

INSULATION**REMOVAL**

- (1) Raise the hood.
- (2) Remove the insulation panel fasteners.
- (3) Remove the hood insulation panel.

INSTALLATION

- (1) Position the insulation panel on the underside of the hood.
- (2) Install the insulation panel fasteners.
- (3) Close the hood.

LATCH**REMOVAL**

- (1) Remove nuts attaching latch to radiator cross-member support (Fig. 2).
- (2) Disconnect hood release cable from latch.
- (3) Separate latch from vehicle.

Fig. 2 Hood Latch

- 1 - HOOD RELEASE CABLE
2 - LATCH
3 - BUMPER

INSTALLATION

- (1) Connect latch release cable to latch.
- (2) Position latch on radiator crossmember support.
- (3) Install nuts attaching latch to radiator cross-member support. Tighten nuts to 11 N·m (8 ft. lbs.) torque (Fig. 2).

LATCH RELEASE CABLE

REMOVAL

- (1) Disconnect cable from hood latch (Fig. 3).
- (2) Disconnect cable from retaining clips on left inner fender panel.
- (3) Remove left cowl side trim panel.
- (4) Remove fasteners attaching cable bracket to cowl side panel (Fig. 4).
- (5) Route cable through dash panel and remove it from under instrument panel.

80b3c70a

Fig. 3 Hood Latch

- 1 - HOOD LATCH
2 - HOOD RELEASE CABLE

INSTALLATION

80b3c6fe

Fig. 4 Hood Release Cable

- 1 - LOWER COWL
2 - HOOD RELEASE CABLE
3 - RELEASE HANDLE

- (1) Route cable through hole in dash panel into engine compartment.
- (2) Pull cable forward and seat grommet in dash panel.
- (3) Position cable bracket on cowl side panel and install fasteners (Fig. 4).
- (4) Install left cowl side trim panel.
- (5) Route and install cable in retaining clips on left inner fender panel.
- (6) Connect cable to hood latch (Fig. 3).

INSTRUMENT PANEL SYSTEM

DESCRIPTION

The instrument panel is located at the front of the passenger compartment (Fig. 1). This instrument panel uses a full-width structural plastic foundation

as its primary support. This foundation structure is often referred to as a structural duct, as the unit also serves as the air flow duct for the heating and air conditioning system panel and demister outlets, which greatly reduces the number of components used over conventional instrument panel construction. The front and rear halves of this structural duct

INSTRUMENT PANEL SYSTEM (Continued)

80a4d115

Fig. 1 Instrument Panel

1 - TOP COVER

2 - TOP PAD

3 - GLOVE BOX

4 - CENTER STACK

5 - STEERING COLUMN OPENING COVER

6 - CLUSTER BEZEL

7 - INSTRUMENT CLUSTER

are molded from a blend of polycarbonate and ABS plastics, which gives these components excellent strength and impact resistance. The two halves of this structural duct are vibration welded together. The instrument cluster, radio, A/C-heater control, passenger airbag, glove box latch strikers and hinges, steering column support bracket, electrical junction block, accessory switches, as well as numerous other components are secured to and supported by this structural duct. The structural duct also features integral vacuum and electrical harness routing troughs. All of these integral features help to reduce the total component part requirements, which reduces assembly complexity and potential buzzes, squeaks and rattles. At the same time, these features make the structural duct-based instrument panel more suitable for recycling by minimizing the number of parts to be removed.

A patented feature of the construction of this instrument panel has the heater and air conditioner housing unit and the steering column secured to the structural duct and installed into the vehicle as a unit during vehicle assembly. This feature helps to improve vehicle

quality by allowing the instrument panel, heater and air conditioner housing unit and the steering column to be assembled and tested outside the vehicle prior to installation, which is easier and more reliable than in-car assembly and testing. This feature also adds a floor panel mounting point to the instrument panel unit, which provides additional stiffness and system integrity. The top of the instrument panel structural duct is secured to the top of the dash panel near the base of the windshield using weld studs with nuts. An end bracket integral to each end of the structural duct is secured to each cowl side inner panel with two screws. A stamped metal bracket supports the center of the structural duct by securing it to the top of the floor panel transmission tunnel below the instrument panel with screws.

The instrument panel for this vehicle includes the following major features:

- **Cluster Bezel** - This molded plastic bezel is secured with snap clips to the instrument panel structural duct. It trims out the lower edge of the instrument cluster, conceals the lower cluster mounting points, and fills the opening between the instrument cluster and the steering column opening cover,

INSTRUMENT PANEL SYSTEM (Continued)

where the steering column passes through the instrument panel. On vehicles built for sale in certain international markets where headlamp leveling is required equipment, the cluster bezel also includes a mounting location for the headlamp leveling switch.

- **Glove Box** - The hinged bin-type glove box in the passenger side of the instrument panel features a recessed paddle-operated latch handle that is offset towards the driver side of the vehicle for easier access. The glove box latching mechanism features two bolt-type latches that engage a striker located on each side of the glove box opening for increased strength and integrity. Three molded hook formations on the lower edge of the glove box door are engaged with and pivot on three hinge pins integral to the lower edge of the structural duct. The glove box door also serves as the passenger side knee blocker. A honeycomb structure between the inner and outer glove box door panels helps to absorb the impact load and distribute it to the instrument panel structural duct.

- **Instrument Panel Center Stack** - The center stack area of the instrument panel features two snap-on bezels. The upper bezel has two integral center panel duct air outlets and conceals the radio and upper heater and air conditioner control mounting hardware. The lower bezel conceals the lower heater and air conditioner control mounting hardware and includes a concealed integral storage bin, which features a push-push latching mechanism and viscous-damped hinges. Pushing in on the face of the bin releases the latch and the bin opens by itself. The lower bezel also houses the two switches for the optional heated driver and passenger front seats, as well as two accessory power outlets. The accessory power outlet to the passenger side of the storage bin is covered by a pivoting door when not in use. The accessory power outlet to the driver side of the storage bin is covered by a snap-in plastic cap when not in use. If the optional smoker's package is ordered, a removable ash receiver is inserted in the storage bin and a cigar lighter is inserted in the driver side accessory power outlet.

- **Instrument Panel Top Cover** - This molded plastic unit incorporates the windshield defroster outlets, the instrument panel speaker grilles, and trims the top of the instrument panel up to the base of the windshield. It also features a dedicated opening located outboard of the driver side defroster duct for the optional automatic headlamp light sensor/vehicle theft security system indicator unit. Models without this optional equipment have a molded plug fitted to this opening in the top cover. The top cover is secured to the instrument panel structural duct with snap clips.

- **Instrument Panel Top Pad** - A foam-padded cast vinyl instrument panel top pad covers the instrument

panel structural duct. This surface is designed to deform upon impact without breaking, while also providing a luxurious feel. The top pad features a grained outer surface and two shallow molded depressions on the top, which can serve as trays to store various small objects. A unique anti-skid texture molded into the top pad surface in the bottom of these depressions will help to prevent objects from shifting in the trays while the vehicle is being driven. The top pad conceals an integral top-hinged steel passenger side airbag door, which is located between the two panel duct air outlets above the glove box. The top pad also features a raised hood formation over the instrument cluster area, which helps to block light reflections from the windshield onto the cluster lens in the daytime, and light reflections from the cluster onto the windshield at night.

- **Steering Column Opening Cover** - The steering column opening cover serves as the driver side knee blocker. This molded plastic cover has an integral ribbed plastic liner concealed behind it, for increased strength and integrity. The steering column opening cover transfers impact loads through a stamped and welded instrument panel steering column bracket to the cast magnesium instrument panel steering column support bracket, which is secured to and distributes the impact load to the instrument panel structural duct.

Hard wired circuitry connects the electrical components on the instrument panel to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the instrument panel components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes complete circuit diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices, and grounds.

The service information found here covers the major instrument panel components. However, complete service information for all of the systems and components housed in the instrument panel in a single area of the service manual would not be practical. Therefore, the coverage for any component mounted on or in the instrument panel and not found here, will be found with the service information covering the vehicle system to which the component belongs. The instrument panel structural duct is serviced only as a complete unit. If it is faulty or damaged, the

INSTRUMENT PANEL SYSTEM (Continued)

entire structural duct unit must be replaced. Most other trim and functional components of the instrument panel are available for service replacement separately from the structural duct.

OPERATION

The instrument panel serves as the command center of the vehicle, which necessarily makes it a very complex unit. The instrument panel is designed to house the controls and monitors for standard and optional powertrains, climate control systems, audio systems, safety systems, and many other comfort or convenience items. When the two primary molded plastic components of the instrument panel structural duct are vibration welded together they provide superior instrument panel stiffness and integrity to help reduce buzzes, squeaks, and rattles. This type of construction also provides improved energy absorption which, in conjunction with the dual airbags and seat belts, helps to improve occupant protection.

The instrument panel is also designed so that all of the various controls can be safely reached and the monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access to each of these items for service. Modular instrument panel construction allows all of the gauges and controls to be serviced from the front of the panel. In addition, most of the instrument panel electrical components can be accessed without complete instrument panel removal. However, if necessary, the instrument panel can be removed from the vehicle as an assembly.

The steering column opening cover with its integral knee blocker located on the driver side of the instrument panel works in conjunction with the airbag system in a frontal vehicle impact to keep the driver properly positioned for an airbag deployment. In addition, removal of this component provides access to the steering column mounts, the steering column wiring, the Junction Block (JB), the electronic combination flasher, and much of the instrument panel wiring. In a frontal collision, the glove box door on the passenger side of the instrument panel provides the same function for the front seat passenger as the knee blocker does for the driver. The glove box door also incorporates a recessed latch handle.

Removal of the instrument panel upper center bezel allows access to the radio and the upper mounts for the heating and air conditioning control. Removal of the lower cluster bezel provides dedicated mounting locations for the heated seat switches, accessory power outlets/cigar lighter, and storage bin/ash receiver. Removal of the lower cluster bezel allows access to the lower mounts for the heating and air conditioning control, the heated seat switches, and the accessory power outlets/cigar lighter. Removal of the instrument cluster bezel

allows access to the instrument cluster. Removal of the instrument cluster allows access to the cluster illumination and indicator lamp bulbs, and more of the instrument panel wiring. Removal of the instrument panel top cover allows access to the instrument panel speakers and the automatic headlamp light sensor/vehicle theft security system indicator unit. Removal of the instrument panel top pad allows access to the passenger airbag. Complete instrument panel removal is required for service of most components of the heating and air conditioning system housing, including the heater core and the evaporator.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the components and systems mounted on or in the instrument panel.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the trim from the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
- (3) Remove the top cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).
- (4) Remove the four nuts that secure the instrument panel to the studs on the dash panel near the windshield fence line (Fig. 2).
- (5) Remove the scuff plates from the right and left front door sills. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
- (6) Remove the trim panels from the right and left inner cowl sides. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).
- (7) Remove the console from the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

INSTRUMENT PANEL SYSTEM (Continued)

**Fig. 2 Instrument Panel to Dash Panel Mounting**

1 - STUD (4)

2 - NUT (4)

3 - INSTRUMENT PANEL

4 - DASH PANEL

(8) Remove the fuse cover from the Junction Block (JB). (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

(9) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(10) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(11) Remove the steering column bracket from the instrument panel steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN BRACKET - REMOVAL).

(12) Remove the screw that secures the lower tilting steering column shroud to the steering column multi-function switch mounting housing (Fig. 3).

(13) Unsnap the two halves of the tilting steering column shroud from each other and remove both halves from the steering column.

(14) Disconnect the instrument panel wire harness connectors from the following steering column components (Fig. 4):

- the two lower clockspring connector receptacles
- the left multi-function switch connector receptacle
- the right multi-function switch connector receptacle
- the two ignition switch connector receptacles
- the shifter interlock solenoid connector receptacle

- 6 - IGNITION SWITCH CONNECTOR RECEPTACLES
- 7 - SKIM CONNECTOR

(15) Turn the ignition switch to the On position, then release and remove the shifter interlock cable connector from the ignition lock housing receptacle.

(16) Turn the ignition switch back to the Lock position to prevent steering wheel rotation and the loss of clockspring centering following steering column removal.

(17) Remove the bolt that secures the coupler to the lower steering column shaft (Fig. 5).

(18) Remove the four nuts that secure the steering column to the studs on the instrument panel steering column support bracket.

(19) Remove the steering column from the instrument panel. Be certain that the steering wheel is locked and secured from rotation to prevent the loss of clockspring centering.

(20) Disconnect the left and right body wire harness connectors, the Ignition Off Draw (IOD) wire harness connector and the fused B(+) wire harness connector from the connector receptacles of the JB (Fig. 6).

(21) Disconnect the instrument panel wire harness connectors from the following floor panel transmission tunnel components (Fig. 7):

- the Airbag Control Module (ACM) connector receptacle
- the park brake switch terminal
- the transmission shifter connector receptacle.

(22) Remove the two nuts that secure the instrument panel wire harness ground eyelets to the studs on the floor panel transmission tunnel in front of and behind the ACM.

(23) Disengage the retainers that secure the instrument panel wire harness to the floor panel transmission tunnel.

(24) Remove the instrument panel to center floor tunnel bracket from the instrument panel and the floor panel transmission tunnel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER FLOOR TUNNEL BRACKET - REMOVAL).

(25) Remove the one screw that secures the floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel and remove the duct from the housing.

(26) If the vehicle is equipped with the manual heating and air conditioning system, disconnect the vacuum harness connector located near the driver side of the floor panel transmission tunnel behind the driver side floor duct.

(27) Remove the one screw that secures the instrument panel steering column support bracket to the driver side end of the heater and air conditioner housing (Fig. 8).

(28) Remove the one screw that secures the instrument panel steering column support bracket to the intermediate bracket on the driver side dash panel (Fig. 9).

(29) Remove the nut that secures the instrument panel steering column support bracket to the stud on the driver side cowl plenum panel (Fig. 10).

(30) Remove the two screws that secure the instrument panel to the driver side cowl side inner panel (Fig. 11).

(31) Remove the end cap from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Prior to installing the instrument panel into the vehicle, loosen the three nuts that secure the instrument panel intermediate bracket and the accelerator pedal assembly to the studs on the dash panel (Fig. 9).

(2) With the aid of an assistant, load the instrument panel assembly through the driver side front

door of the vehicle and hang it on the studs on the dash panel near the windshield fence line (Fig. 2).

(3) Be certain that the molded plastic hook formations on the instrument panel structural duct are inserted into and seated in the guide holes at each cowl side inner panel.

(4) Loosely install the two screws that secure each end of the instrument panel to the cowl side inner panels.

(5) Install and tighten the two screws that secure the passenger side instrument panel structural duct to the heater and air conditioner housing (Fig. 14). Tighten the screws to 11.8 N·m (105 in. lbs.).

(6) Install and tighten the one screw that secures the instrument panel steering column support bracket to the driver side end of the heater and air conditioner housing (Fig. 8). Tighten the screw to 11.8 N·m (105 in. lbs.).

(7) Tighten the two screws that secure each end of the instrument panel to the cowl side inner panels (Fig. 11) and (Fig. 15). Tighten the screws to 11.8 N·m (105 in. lbs.).

(8) Install and tighten the one screw that secures the instrument panel steering column support bracket to the intermediate bracket on the driver side dash panel (Fig. 9). Tighten the screw to 11.3 N·m (100 in. lbs.).

(9) Tighten the three nuts that secure the instrument panel intermediate bracket and the accelerator pedal assembly to the studs on the dash panel. Tighten the nuts to 11.3 N·m (100 in. lbs.).

(10) Install and tighten the four nuts that secure the instrument panel to the studs on the dash panel near the windshield fence line. Tighten the nuts to 11.8 N·m (105 in. lbs.).

(11) Install and tighten the nut that secures the instrument panel steering column support bracket to the stud on the driver side cowl plenum panel (Fig. 10). Tighten the nut to 28.2 N·m (250 in. lbs.).

(12) Reinstall the instrument panel to center floor tunnel bracket onto the instrument panel and the floor panel transmission tunnel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER FLOOR TUNNEL BRACKET - INSTALLATION).

(13) Reconnect the two instrument panel wire harness connectors to the two heater and air conditioner housing connectors located near the blower motor on the passenger side end of the housing (Fig. 13).

(14) Reconnect the two halves of the radio antenna coaxial cable connector near the right cowl side inner panel under the end of the instrument panel.

(15) Reconnect the instrument panel wire harness connector to the lower cavity of the inline connector on the passenger side cowl side inner panel and tighten the connector screw (Fig. 12). Tighten the screw to 4 N·m (36 in. lbs.).

INSTRUMENT PANEL SYSTEM (Continued)

(16) Reinstall the lower right center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP LOWER RIGHT CENTER BEZEL - INSTALLATION).

(17) Reinstall the end cap onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(18) If the vehicle is equipped with the manual heating and air conditioning system, reconnect the vacuum harness connector located near the driver side of the floor panel transmission tunnel behind the driver side floor duct.

(19) Position the driver side floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel (Fig. 8).

(20) Install and tighten the one screw that secures the driver side floor duct to the heater and air conditioner housing near the driver side of the floor panel transmission tunnel. Tighten the screw to 2.2 N·m (20 in. lbs.).

(21) Route the instrument panel wire harness to the floor panel transmission tunnel and engage the retainers that secure the harness to the mounting brackets on the tunnel (Fig. 7).

(22) Install the instrument panel wire harness ground eyelets to the studs on the floor panel transmission tunnel in front of and behind the airbag control module and secure the eyelets with nuts. Tighten the nuts to 7.3 N·m (65 in. lbs.).

(23) Reconnect the instrument panel wire harness connectors to the following floor panel transmission tunnel components:

- the Airbag Control Module (ACM) connector receptacle
- the park brake switch terminal
- the transmission shifter connector receptacle.

(24) Reconnect the left and right body wire harness connectors, the Ignition Off Draw (IOD) wire harness connector and the fused B(+) wire harness connector to the connector receptacles of the Junction Block (JB) and tighten the connector screws (Fig. 6). Tighten the screws to 4 N·m (36 in. lbs.).

(25) Engage the lower steering column shaft with the steering shaft coupler and position the steering column to the mounting studs on the instrument panel steering column support bracket (Fig. 5).

(26) Install and tighten the four nuts that secure the steering column to the studs on the instrument panel steering column support bracket. Tighten the nuts to 11.8 N·m (105 in. lbs.).

(27) Install and tighten the bolt that secures the coupler to the lower steering column shaft. Tighten the bolt to 49 N·m (36 ft. lbs.).

(28) Turn the ignition switch to the On position, then install the shifter interlock cable connector into the ignition lock housing receptacle.

(29) Reconnect the instrument panel wire harness connectors to the following steering column components (Fig. 4):

- the two lower clockspring connector receptacles
- the left multi-function switch connector receptacle
- the right multi-function switch connector receptacle
- the two ignition switch connector receptacles
- the shifter interlock solenoid connector receptacle
- if the vehicle is so equipped, the Sentry Key Immobilizer Module (SKIM) connector receptacle.

(30) Position the lower tilting steering column shroud to the steering column multi-function switch mounting housing, then install and tighten the screw that secures the shroud to the housing (Fig. 3). Tighten the screw to 1.9 N·m (17 in. lbs.).

(31) Position the upper tilting steering column shroud over the steering column. Align the upper and lower shrouds with each other and snap the two halves together.

(32) Reinstall the steering column bracket onto the instrument panel steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/IP STEERING COLUMN BRACKET - INSTALLATION).

(33) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(34) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(35) Reinstall the fuse cover onto the Junction Block (JB). (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(36) Reinstall the console onto the floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(37) Reinstall the trim panels onto the right and left inner cowl sides. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

(38) Reinstall the scuff plates onto the right and left front door sills. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).

(39) Reinstall the top cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

(40) Reinstall the trim onto the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(41) Reconnect the battery negative cable.

CLUSTER BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Place the tilt steering wheel in its fully lowered position.
- (3) Using a trim stick or another suitable wide flat-bladed tool, gently pry each of the four corners of the cluster bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 16).

Fig. 16 Cluster Bezel Remove/Install

- 1 - INSTRUMENT CLUSTER
- 2 - INSTRUMENT PANEL CLUSTER BEZEL
- 3 - STEERING COLUMN OPENING COVER

(4) Being certain not to scratch the instrument cluster lens with the two snap clips on the lower edge of the cluster bezel, roll the top of the cluster bezel rearward over the top of the steering column.

(5) If the vehicle is so equipped, reach behind the cluster bezel to access and disconnect the instrument panel wire harness connector for the headlamp leveling switch from the switch connector receptacle.

(6) Remove the cluster bezel from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the cluster bezel onto the instrument panel (Fig. 16).

(2) If the vehicle is so equipped, reach behind the cluster bezel to access and reconnect the instrument panel wire harness connector for the headlamp leveling switch to the switch connector receptacle.

(3) Being certain not to scratch the instrument cluster lens with the two snap clips on the lower edge of the cluster bezel, slide the lower edge of the cluster bezel forward and down over the top of the steering column to position it onto the instrument panel.

(4) Align the two snap clips on the lower edge of the cluster bezel with their receptacles in the instrument panel.

(5) Press firmly on the cluster bezel over each of the lower snap clip locations until each of the snap clips is fully engaged in its receptacle.

(6) Align the two receptacles on the upper edge of the cluster bezel with the snap clips on the instrument panel.

(7) Press firmly on the cluster bezel over each of the upper snap clip locations until each of the snap clips is fully engaged in its receptacle.

(8) Reconnect the battery negative cable.

GLOVE BOX

STANDARD PROCEDURE - GLOVE BOX ROLL DOWN

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Open the glove box until the integral stops on the back edge of the glove box bin are resting against the rubber stop bumpers in the upper glove box opening reinforcement.

(3) Reach into the glove box and with the middle finger of each hand, deflect the rubber flap of the two glove box stop bumpers on the upper glove box opening reinforcement toward the front of the vehicle.

(4) With the glove box stop bumpers deflected, roll the glove box door downward until the integral stops on the back edge of the glove box bin pass through the rubber stop bumper openings in the upper glove box opening reinforcement (Fig. 17)

80b897d5

Fig. 17 Glove Box Roll Down

1 - GLOVE BOX DOOR

(5) The rubber stop bumpers will be deflected automatically by the integral stops on the back of the glove box when the glove box is rolled back up into the instrument panel.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Roll the glove box down from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

NOTE: Be certain to use care not to damage or remove the glove box hinge bumpers on the lower instrument panel glove box opening reinforcement when removing the glove box from the instrument panel.

(3) Firmly grip both ends of the glove box door, then twist and pull the door as necessary to disengage the inboard hinge hook from the inboard hinge pin on the instrument panel and reorient the hook to the underside of the hinge pin (Fig. 18).

(4) Raise the glove box door until it is perpendicular to the instrument panel.

(5) Twist the door slightly in the counterclockwise direction and use a jiggling action to disengage the remaining two hinge hooks from their respective hinge pins on the instrument panel.

(6) Remove the glove box from the instrument panel.

GLOVE BOX (Continued)

**Fig. 18 Glove Box Remove/Install**

1 - GLOVE BOX HINGE HOOKS AND HINGE PINS (3)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

NOTE: Be certain to use care not to damage or remove the glove box hinge bumpers on the lower instrument panel glove box opening reinforcement when installing the glove box onto the instrument panel.

(1) Position the glove box to the instrument panel with the outboard hinge hook oriented over the outboard hinge pin and the center hinge hook oriented under the center hinge pin (Fig. 18).

(2) Raise the glove box door until it is perpendicular to the instrument panel.

(3) Firmly grip both ends of the glove box door and twist the door slightly in the clockwise direction to engage the inboard glove box hinge hook over the inboard hinge pin on the instrument panel.

(4) Roll the glove box back up into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(5) Reconnect the battery negative cable.

GLOVE BOX LATCH**REMOVAL**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Roll down the glove box from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(3) Remove the three screws that secure the glove box latch to the inner glove box door (Fig. 19).

(4) Lift up on the latch handle on the outer glove box door far enough to loosen the latch assembly on the inner glove box door.

(5) Remove the latch unit from the inner glove box door.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

GLOVE BOX LATCH (Continued)

**Fig. 19 Glove Box Latch Remove/Install**

- 2 - LATCH HANDLE
- 3 - LATCH HANDLE POCKET
- 4 - BIN
- 5 - HINGE HOOKS
- 6 - DOOR
- 7 - GLOVE BOX LATCH
- 8 - STOPS

(1) Position the latch unit to the inner glove box door (Fig. 19).

(2) Guide the latch handle into the latch handle pocket on the outer glove box door.

(3) Install and tighten the three screws that secure the glove box latch to the inner glove box door. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Roll the glove box back up into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(5) Reconnect the battery negative cable.

GLOVE BOX LATCH STRIKER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS

IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) If the inboard glove box latch striker is being serviced, remove the lower right center bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP LOWER RIGHT CENTER BEZEL - REMOVAL). If the outboard glove box latch striker is being serviced, remove the end cap from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(3) Remove the one screw that secures the upper mounting flange of the glove box latch striker to the instrument panel structural duct at either side of the glove box opening (Fig. 20).

**Fig. 20 Glove Box Latch Striker Remove/Install**

- 1 - SCREW
- 2 - GLOVE BOX LATCH STRIKER
- 3 - INSTRUMENT PANEL TOP PAD

(4) Pull the upper mounting flange of the glove box latch striker downward to disengage the hook formation on the lower end of the striker from the mounting hole in the instrument panel structural duct.

(5) Remove the glove box latch striker from the instrument panel.

GLOVE BOX LATCH STRIKER (Continued)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the glove box latch striker to the instrument panel.

(2) Engage the hook formation on the lower end of the glove box latch striker in the mounting hole in the instrument panel structural duct.

(3) Roll the upper mounting flange of the glove box latch striker upward until it is flush with the instrument panel structural duct on either side of the glove box opening.

(4) Install and tighten the screw that secures the upper mounting flange of the glove box latch striker to the instrument panel structural duct (Fig. 20). Tighten the screw to 2.2 N·m (20 in. lbs.).

(5) If the inboard glove box latch striker was serviced, reinstall the lower right center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP LOWER RIGHT CENTER BEZEL - INSTALLATION). If the outboard glove box latch striker was serviced, reinstall the end cap onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(6) Reconnect the battery negative cable.

LATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and open the glove box.

(3) Remove the one screw that secures the outboard end of the end cap to the instrument panel top pad (Fig. 21).

80b6b329

INSTRUMENT PANEL END CAP

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISO-

(4) Remove the three screws that secure the end cap to the instrument panel glove box opening.

(5) Pull the end cap straight back from the instrument panel to disengage the one snap clip that secures it to the receptacle in the instrument panel structural duct.

(6) Remove the end cap from the instrument panel.

INSTRUMENT PANEL END CAP (Continued)

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Be certain that the glove box catch bumper is installed in the mounting hole nearest the outboard end of the end cap extension over the instrument panel upper glove box opening reinforcement (Fig. 21).

(2) Position the end cap to the instrument panel. Be certain that the end of the end cap extension near the center of the upper glove box opening reinforcement is positioned underneath the end of the extension from the lower right center bezel.

(3) Align the snap clip on the end cap with the receptacle on the instrument panel structural duct.

(4) Press firmly on the instrument panel end cap over the snap clip location until the snap clip is fully engaged in its receptacle.

(5) Install and tighten the three screws that secure the end cap to the instrument panel glove box opening. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Install and tighten the one screw that secures the outboard end of the end cap to the instrument panel top pad. Tighten the screw to 2.2 N·m (20 in. lbs.).

(7) Close and latch the glove box.

(8) Reconnect the battery negative cable.

INSTRUMENT PANEL
STRUCTURAL DUCT

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING

COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel on a suitable work surface. Be certain to take the proper precautions to protect the instrument panel from any possible cosmetic damage.

(4) Remove all of the individual components that remain secured to the instrument panel structural duct as described elsewhere in this service information.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Reinstall all of the individual components that were removed from the instrument panel structural duct as described elsewhere in this service information.

(2) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(3) Reconnect the battery negative cable.

INSTRUMENT PANEL TOP COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Using a trim stick or another suitable wide flat-bladed tool, gently pry the rear edge (farthest from the windshield) of the top cover up and away from the instrument panel far enough to disengage the four snap clip retainers from their receptacles in the instrument panel top pad (Fig. 22).

80b6b323

Fig. 22 Instrument Panel Top Cover Remove/Install

- 1 - ULTRA LIGHT SENSOR PLUG
- 2 - SEAL
- 3 - INSTRUMENT PANEL TOP COVER

- (3) Remove the top cover from the top of the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) If the vehicle is not equipped with the optional automatic headlamps light sensor/vehicle theft security system indicator, be certain that the hole plug is installed in the clearance hole located to the out-board side of the driver side defroster outlet in the instrument panel top cover (Fig. 22).
- (2) Before installing the top cover onto the top of the instrument panel, be certain that the rubber top cover seal is properly positioned on the forward edge of the top cover panel.
- (3) Position the top cover onto the top of the instrument panel.
- (4) Align the four snap clips on the top cover with the snap clip receptacles in the instrument panel top pad.
- (5) Press firmly downward on the top cover over each of the four snap clip locations until each of the snap clips is fully seated in their receptacles in the instrument panel top pad.
- (6) Reconnect the battery negative cable.

INSTRUMENT PANEL TOP PAD

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSTRUMENT PANEL TOP PAD (Continued)

80b3c645

Fig. 23 Instrument Panel Top Pad to Dash Panel Mounting

1 - STUD (4)
2 - NUT (4)

3 - INSTRUMENT PANEL
4 - DASH PANEL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the trim from the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

(3) Remove the top cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - REMOVAL).

(4) Remove the four nuts that secure the instrument panel top pad to the studs on the dash panel near the windshield fence line (Fig. 23).

(5) Remove the speakers from the instrument panel top pad. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL - INSTRUMENT PANEL SPEAKER).

(6) Disengage the retainer that secures each of the two instrument panel wire harness speaker take outs to the mounting hole in the instrument panel top pad. Tuck the loose ends of these speaker take outs down the defroster ducts to keep them out of the way during the remainder of this procedure.

(7) If the vehicle is so equipped, remove the two screws that secure the automatic headlamp light sensor/vehicle theft security system indicator unit to the instrument panel top pad just outboard of the driver side defroster outlet. Move the sensor/indicator unit towards the windshield to keep it out of the way during the remainder of this procedure.

(8) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(9) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(10) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(11) Roll the glove box down from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(12) Remove the end cap from the passenger side lower outboard end of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - REMOVAL).

(13) Remove the lower right center bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP LOWER RIGHT CENTER BEZEL - REMOVAL).

(14) Remove the glove box lamp and switch from the instrument panel. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/GLOVE BOX LAMP/SWITCH - REMOVAL).

(15) Remove the two large screws on the glove box opening upper reinforcement that secure the top pad to the instrument panel structural duct (Fig. 24).

INSTRUMENT PANEL TOP PAD (Continued)

Fig. 24 Instrument Panel Top Pad to Glove Box Opening Mounting

- 1 - PASSENGER SIDE TRIM BEZEL
- 2 - PANEL OUTLETS
- 3 - SMALL SCREWS
- 4 - LARGE SCREWS
- 5 - GLOVE BOX OPENING UPPER REINFORCEMENT

(16) Remove the two small screws on the glove box opening upper reinforcement that secure the panel outlets to the instrument panel structural duct.

(17) Remove the center upper bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - UPPER - REMOVAL).

(18) Remove the center lower bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - LOWER - REMOVAL).

(19) Remove the four screws that secure the radio to the instrument panel structural duct. Pull the radio out of the instrument panel only far enough to access the screws that secure the top pad to the instrument panel structural duct.

(20) Remove the four screws that secure the heater-A/C control to the instrument panel structural duct. Pull the heater-A/C control out of the instrument panel only far enough to access the screws that secure the top pad to the instrument panel structural duct.

(21) Remove all of the screws that secure the perimeter of the top pad to the instrument panel structural duct.

(22) Remove the front bin from the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(23) Reach through the front bin opening of the floor console to access and remove the two screws that secure the center floor tunnel bracket to the instrument panel.

(24) Reach through the front bin opening of the floor console to access and loosen the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel.

(25) Slide the center floor tunnel bracket rearward in the vehicle far enough to disengage the locating hole in the lower flange of the top pad from the locating pin on the instrument panel structural duct (Fig. 25).

Fig. 25 Instrument Panel Top Pad Remove/Install

- 1 - STRUCTURAL DUCT
- 2 - LOCATING PIN
- 3 - INSTRUMENT PANEL TOP PAD
- 4 - LOWER FLANGE
- 5 - CENTER FLOOR TUNNEL BRACKET

(26) Remove the instrument panel top pad from the instrument panel structural duct.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

If the top pad is being replaced with a new unit, be certain to transfer or install the panel outlets and the passenger side trim bezel to the new unit before it is installed on the instrument panel structural duct. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/AIR OUTLETS - REMOVAL) and (Refer to 23 - BODY/INSTRUMENT PANEL/IP TRIM BEZEL - PASSENGER - REMOVAL).

INSTRUMENT PANEL TOP PAD (Continued)

(1) Position the instrument panel top pad over the instrument panel structural duct and the studs on the dash panel near the windshield fence line.

(2) Route the instrument panel wire harness take out for the glove box lamp and switch unit to the switch mounting hole in the upper glove box opening reinforcement.

(3) Reach through the front bin opening of the floor console to engage the locating hole in the lower flange of the top pad with the locating pin on the instrument panel structural duct (Fig. 25).

(4) Reach through the front bin opening of the floor console to slide the center floor tunnel bracket forward in the vehicle far enough to capture the lower flange of the top pad between the bracket and the structural duct.

(5) Reach through the front bin opening of the floor console to install and tighten the two screws that secure the center floor tunnel bracket to the instrument panel. Tighten the screws to 11.8 N·m (105 in. lbs.).

(6) Reach through the front bin opening of the floor console to access and tighten the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel. Tighten the nuts to 11.8 N·m (105 in. lbs.).

(7) Reinstall the front bin into the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(8) Install and tighten all of the screws that secure the perimeter of the top pad to the instrument panel structural duct. Tighten the screws to 2.2 N·m (20 in. lbs.).

(9) Install and tighten the four screws that secure the heater-A/C control to the instrument panel structural duct. Tighten the screws to 2.2 N·m (20 in. lbs.).

(10) Install and tighten the four screws that secure the radio to the instrument panel structural duct. Tighten the screws to 2.2 N·m (20 in. lbs.).

(11) Reinstall the center lower bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - LOWER - INSTALLATION).

(12) Reinstall the center upper bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - UPPER - INSTALLATION).

(13) Install and tighten the two large screws on the glove box opening upper reinforcement that secure the top pad to the instrument panel structural duct (Fig. 24). Tighten the screws to 11.8 N·m (105 in. lbs.).

(14) Install and tighten the two small screws on the glove box opening upper reinforcement that secure the panel outlets to the instrument panel structural duct. Tighten the screws to 2.2 N·m (20 in. lbs.).

(15) Reinstall the glove box lamp and switch into the instrument panel. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR/GLOVE BOX LAMP/SWITCH - INSTALLATION).

(16) Reinstall the lower right center bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP LOWER RIGHT CENTER BEZEL - INSTALLATION).

(17) Reinstall the end cap onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL END CAP - INSTALLATION).

(18) Roll the glove box back up into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - STANDARD PROCEDURE - GLOVE BOX ROLL DOWN).

(19) Reinstall the steering column opening cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(20) Reinstall the instrument cluster into the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

(21) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(22) If the vehicle is so equipped, position the automatic headlamp light sensor/vehicle theft security system indicator unit to the instrument panel top pad just outboard of the driver side defroster outlet. Install and tighten the two screws that secure the sensor/indicator unit. Tighten the screws to 2.2 N·m (20 in. lbs.).

(23) Engage the retainer that secures each of the two instrument panel wire harness speaker take outs to the mounting hole in the instrument panel top pad.

(24) Reinstall the speakers onto the instrument panel top pad. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION - INSTRUMENT PANEL SPEAKER).

(25) Install and tighten the four nuts that secure the instrument panel top pad to the studs on the dash panel near the windshield fence line (Fig. 23). Tighten the nuts to 11.8 N·m (105 in. lbs.).

(26) Reinstall the top cover onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP COVER - INSTALLATION).

(27) Reinstall the trim onto the right and left A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(28) Reconnect the battery negative cable.

INSTRUMENT PANEL C-CHANNEL COVER BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel top down on a suitable work surface. Be certain to take the proper precautions to protect the top of the instrument panel from any possible cosmetic damage.

(4) Disengage the radio antenna coaxial cable retainer from the mounting hole in the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel C-channel cover bracket.

(5) Remove the screw that secures the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel C-channel cover bracket (Fig. 26).

(6) Remove the screw that secures the passenger side courtesy lamp to the lower tab of instrument panel C-channel cover bracket.

(7) Remove the eight screws that secure the C-channel cover bracket to the instrument panel structural duct.

(8) Remove the C-channel cover bracket from the instrument panel structural duct.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYS-

- 5 - STRUCTURAL DUCT

TEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the C-channel cover bracket to the instrument panel structural duct.

(2) Install and tighten the eight screws that secure the C-channel cover bracket to the instrument panel structural duct (Fig. 26). Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Position the passenger side courtesy lamp to the lower tab of instrument panel C-channel cover bracket.

(4) Install and tighten the screw that secures the passenger side courtesy lamp to the lower tab of instrument panel C-channel cover bracket. Tighten the screw to 2.2 N·m (20 in. lbs.).

(5) Position the instrument panel wire harness mounting tab to the passenger side outboard end of the instrument panel C-channel cover bracket.

(6) Install and tighten the screw that secures the instrument panel wire harness mounting tab to the passenger side outboard end of the instrument panel C-channel cover bracket. Tighten the screw to 2.2 N·m (20 in. lbs.).

(7) Engage the radio antenna coaxial cable retainer in the mounting hole in the instrument panel wire harness mounting tab on the passenger side outboard end of the instrument panel C-channel cover bracket.

INSTRUMENT PANEL C-CHANNEL COVER BRACKET (Continued)

(8) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(9) Reconnect the battery negative cable.

INSTRUMENT PANEL CENTER BEZEL - LOWER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry each of the four corners of the center lower bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 27).

80b897d7

**Fig. 27 Instrument Panel Center Lower Bezel
Remove/Install**

- 1 - HEATER AND AIR CONDITIONER CONTROLS
- 2 - TRIM STICK
- 3 - CENTER LOWER BEZEL

(3) Pull the center lower bezel away from the instrument panel far enough to access the instrument panel wire harness connectors.

(4) Squeeze the mounting legs of the ash receiver lamp hood and remove it from the rectangular hole in the ash receiver flame shield.

(5) If the vehicle is so equipped, disconnect the instrument panel wire harness connectors for the two heated seat switches from the switch connector receptacles.

(6) Disconnect the instrument panel wire harness connectors for the cigar lighter and accessory power outlet from the lighter and outlet connector receptacles.

(7) Remove the center lower bezel from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the center lower bezel to the instrument panel.

(2) Reconnect the instrument panel wire harness connectors for the cigar lighter and the accessory power outlet to the lighter and outlet connector receptacles.

(3) If the vehicle is so equipped, reconnect the instrument panel wire harness connectors for the two heated seat switches to the switch connector receptacles.

(4) Squeeze the mounting legs of the ash receiver lamp hood and install them into the rectangular hole in the ash receiver flame shield.

(5) Align the two lower snap clips on the center lower bezel with their receptacles in the instrument panel top pad.

(6) Using hand pressure, press firmly and evenly on the center lower bezel over each of the lower snap clip locations until each of the snap clips is fully engaged in its receptacle.

(7) Align the two upper snap clips on the center lower bezel with their receptacles in the instrument panel top pad.

INSTRUMENT PANEL CENTER BEZEL - LOWER (Continued)

(8) Using hand pressure, press firmly and evenly on the center lower bezel over each of the upper snap clip locations until each of the snap clips is fully engaged in its receptacle.

(9) Reconnect the battery negative cable.

INSTRUMENT PANEL CENTER BEZEL - UPPER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry each of the four corners of the center upper bezel away from the instrument panel far enough to disengage the four snap clips from their receptacles (Fig. 28).

**Fig. 28 Instrument Panel Center Upper Bezel
Remove/Install**

- 1 - CENTER UPPER BEZEL
2 - RADIO
3 - TRIM STICK

(3) Remove the center upper bezel from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the center upper bezel onto the instrument panel.

(2) Align the four snap clips on the center upper bezel with their receptacles in the instrument panel top pad.

(3) Using hand pressure, press firmly and evenly on the center upper bezel over each of the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the front bin from the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

(3) Reach through the front bin opening of the floor console to access and disengage the instrument

INSTRUMENT PANEL CENTER FLOOR TUNNEL BRACKET (Continued)

panel wire harness retainer from the mounting hole on the driver side of the instrument panel center floor tunnel bracket.

(4) Remove the two screws that secure the center floor tunnel bracket to the instrument panel (Fig. 29).

Fig. 29 Instrument Panel Center Floor Tunnel Bracket Remove/Install

- 1 - SCREW (2)
- 2 - NUT (2)
- 3 - STUDS
- 4 - CENTER FLOOR TUNNEL BRACKET

(5) Remove the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel.

(6) Remove the center floor tunnel bracket from the instrument panel and the floor panel transmission tunnel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the center floor tunnel bracket over the floor panel transmission tunnel studs and slide it up against the instrument panel (Fig. 29).

(2) Install and tighten the two nuts that secure the center floor tunnel bracket to the studs on the floor panel transmission tunnel. Tighten the nuts to 11.3 N·m (100 in. lbs.).

(3) Install and tighten the two screws that secure the center floor tunnel bracket to the instrument panel. Tighten the screws to 11.3 N·m (100 in. lbs.).

(4) Reach through the front bin opening of the floor console to access and engage the instrument panel wire harness retainer with the mounting hole on the driver side of the instrument panel center floor tunnel bracket.

(5) Reinstall the front bin into the floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(6) Reconnect the battery negative cable.

INSTRUMENT PANEL COURTESY LAMP BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel fuse cover from the bottom of the Junction Block (JB) and Body Control Module (BCM) unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

(3) Reach under the steering column opening cover to access and remove the screw that secures the courtesy lamp unit to the lower end of the instrument panel courtesy lamp bracket near the inboard side of the JB (Fig. 30).

(4) Remove the courtesy lamp from the lower end of the courtesy lamp bracket.

INSTRUMENT PANEL COURTESY LAMP BRACKET (Continued)

**Fig. 30 Instrument Panel Courtesy Lamp Bracket
Remove/Install**

- 1 - STEERING COLUMN
- 2 - SCREW
- 3 - COURTESY LAMP BRACKET
- 4 - DRIVER SIDE COURTESY LAMP
- 5 - JUNCTION BLOCK
- 6 - SCREW

(5) Reach under the steering column opening cover to access and remove the screw that secures the courtesy lamp bracket and the inboard side of the JB to the instrument panel steering column support bracket.

(6) Remove the courtesy lamp bracket from the inboard side of the JB and the instrument panel steering column support bracket.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Reach under the instrument panel to position the upper end of the courtesy lamp bracket to the inboard side of the Junction Block (JB) and the instrument panel steering column support bracket (Fig. 30).

(2) Install and tighten the screw that secures the courtesy lamp bracket and the inboard side of the JB to the instrument panel steering column support bracket. Tighten the screw to 2.2 N·m (20 in. lbs.).

(3) Position the courtesy lamp to the lower end of the courtesy lamp bracket.

(4) Install and tighten the screw that secures the courtesy lamp to the lower end of the courtesy lamp bracket. Tighten the screw to 2.2 N·m (20 in. lbs.).

(5) Reinstall the instrument panel fuse cover to the bottom of the JB and Body Control Module (BCM) unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(6) Reconnect the battery negative cable.

INSTRUMENT PANEL INTERMEDIATE BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the accelerator pedal assembly from the shoulder studs on the dash panel. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - REMOVAL).

(3) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(4) Remove the one nut that secures the instrument panel intermediate bracket to the stud on the dash panel (Fig. 31).

(5) Remove the instrument panel intermediate bracket from the two shoulder studs and the one stud on the dash panel.

- 7 - SHOULDER STUDS

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the instrument panel intermediate bracket to the two shoulder studs and the one stud on the dash panel (Fig. 31).

(2) Loosely install the one nut that secures the intermediate bracket to the one stud on the dash panel.

(3) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(4) Reinstall the accelerator pedal assembly onto the shoulder studs on the dash panel. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/ACCELERATOR PEDAL - INSTALLATION).

(5) Reconnect the battery negative cable.

INSTRUMENT PANEL LOWER
RIGHT CENTER BEZEL

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unlatch and open the glove box.

(3) Remove the three screws that secure the lower right center bezel to the instrument panel glove box opening (Fig. 32).

(4) Pull the lower right center bezel straight back from the instrument panel to disengage the two snap clips that secure it to the receptacles in the instrument panel top pad.

(5) Remove the lower right center bezel from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

INSTRUMENT PANEL LOWER RIGHT CENTER BEZEL (Continued)

Fig. 32 Instrument Panel Lower Right Center Bezel Remove/Install

- 1 - INSTRUMENT PANEL TOP PAD
- 2 - END CAP
- 3 - SCREWS (3)
- 4 - BUMPER
- 5 - LOWER RIGHT CENTER BEZEL

(1) Be certain that the glove box catch bumper is installed in the mounting hole nearest the inboard end of the lower right center bezel extension over the instrument panel upper glove box opening reinforcement.

(2) Position the lower right center bezel to the instrument panel. Be certain that the end of the lower right center bezel extension near the center of the upper glove box opening reinforcement is positioned on top of the end of the extension from the end cap (Fig. 32).

(3) Align the snap clips on the lower right center bezel with the receptacles in the instrument panel top pad.

(4) Using hand pressure, press firmly on the lower right center bezel over each of the snap clip locations until the snap clips are fully engaged in their receptacles.

(5) Install and tighten the three screws that secure the lower right center bezel to the instrument panel glove box opening. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Close and latch the glove box.

(7) Reconnect the battery negative cable.

INSTRUMENT PANEL PLENUM BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - REMOVAL).

(3) Place the instrument panel top down on a suitable work surface. Be certain to take the proper precautions to protect the top of the instrument panel from any possible cosmetic damage.

(4) Remove the one screw that secures the plenum bracket to the instrument panel steering column support bracket (Fig. 33).

Fig. 33 Instrument Panel Plenum Bracket Remove/Install

- 1 - INSTRUMENT PANEL WIRE HARNESS
- 2 - PLENUM BRACKET
- 3 - STEERING COLUMN SUPPORT BRACKET
- 4 - SCREW

INSTRUMENT PANEL PLENUM BRACKET (Continued)

(5) Remove the plenum bracket from the instrument panel steering column support bracket.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the plenum bracket to the instrument panel steering column support bracket (Fig. 33).

(2) Install and tighten the one screw that secures the plenum bracket to the instrument panel steering column support bracket. Tighten the screw to 11.8 N·m (105 in. lbs.).

(3) Reinstall the instrument panel into the vehicle. (Refer to 23 - BODY/INSTRUMENT PANEL - INSTALLATION).

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL
STEERING COLUMN BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the steering column opening cover from the instrument panel. (Refer to 23 - BODY/IN-

STRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

(3) Remove the four screws that secure the steering column bracket to the instrument panel steering column support bracket (Fig. 34).

80b6b32d

Fig. 34 Instrument Panel Steering Column Bracket Remove/Install

1 - INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET

2 - SCREW (4)

3 - INSTRUMENT PANEL STEERING COLUMN BRACKET

(4) Remove the steering column bracket from the instrument panel steering column support bracket.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the steering column bracket to the instrument panel steering column support bracket (Fig. 34).

(2) Install and tighten the four screws that secure the steering column bracket to the instrument panel steering column support bracket. Tighten the screws to 11.8 N·m (105 in. lbs.).

INSTRUMENT PANEL STEERING COLUMN BRACKET (Continued)

(3) Reinstall the steering column opening cover. (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument cluster from the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL).

(3) Remove the instrument panel plenum bracket from the steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/IP PLENUM BRACKET - REMOVAL).

(4) Remove the three screws that secure the instrument panel wire harness mounting tabs to the back of the steering column support bracket.

(5) Remove the two screws that secure the 16-way data link connector to the instrument panel steering column support bracket and remove the connector from the bracket (Fig. 35).

(6) Remove the Junction Block (JB) and Body Control Module (BCM) unit from the instrument panel steering column support bracket, but do not disconnect any of the instrument panel wire harness connectors from the unit. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - REMOVAL).

(7) From the face of the instrument panel, remove the five screws that secure the steering column support bracket to the instrument panel structural duct.

(8) Remove the steering column support bracket from the instrument panel structural duct.

Fig. 35 Instrument Panel Steering Column Support Bracket Remove/Install

- 1 - STRUCTURAL DUCT
- 2 - SCREWS (5)
- 3 - 16-WAY DATA LINK CONNECTOR
- 4 - STEERING COLUMN SUPPORT BRACKET

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the steering column support bracket to the instrument panel structural duct.

(2) From the face of the instrument panel, install and tighten the five screws that secure the steering column support bracket to the instrument panel structural duct (Fig. 35). Tighten the screws to 11.8 N·m (105 in. lbs.).

(3) Position the instrument panel wire harness mounting tabs to the back of the steering column support bracket.

(4) Install and tighten the three screws that secure the instrument panel wire harness mounting tabs to

INSTRUMENT PANEL STEERING COLUMN SUPPORT BRACKET (Continued)

the back of the steering column support bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Reinstall the instrument panel plenum bracket onto the steering column support bracket. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL PLENUM BRACKET - INSTALLATION).

(6) Reinstall the Junction Block (JB) and Body Control Module (BCM) unit onto the instrument panel steering column support bracket. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/JUNCTION BLOCK - INSTALLATION).

(7) Position the 16-way data link connector to the instrument panel steering column support bracket.

(8) Install and tighten the two screws that secure the 16-way data link connector to the instrument panel steering column support bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(9) Reinstall the instrument cluster onto the instrument panel. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION).

(10) Reconnect the battery negative cable.

INSTRUMENT PANEL TRIM BEZEL - DRIVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry the edges of the driver side trim bezel up and away from the instrument panel far enough to disengage the two snap clips from their receptacles (Fig. 36).

(3) Remove the driver side trim bezel from the instrument panel top pad.

Fig. 36 Instrument Panel Driver Side Trim Bezel Remove/Install

- 1 - INSTRUMENT PANEL TOP PAD
- 2 - DRIVER SIDE TRIM BEZEL
- 3 - TRIM STICK
- 4 - PANEL OUTLET

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the driver side trim bezel to the instrument panel top pad.

(2) Align the snap clips on the driver side trim bezel with the receptacles in the instrument panel top pad.

(3) Using hand pressure, press firmly and evenly on the driver side trim bezel over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Reconnect the battery negative cable.

INSTRUMENT PANEL TRIM BEZEL - PASSENGER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the top pad from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).
- (3) From the underside of the top pad, remove the four screws from the top of the passenger airbag door that secure the passenger side trim bezel to the instrument panel (Fig. 37).

**Fig. 37 Instrument Panel Passenger Side Trim Bezel
Remove/Install**

- 1 - INSTRUMENT PANEL AIRBAG DOOR REINFORCEMENT
- 2 - PASSENGER AIRBAG DOOR
- 3 - PASSENGER SIDE TRIM BEZEL SCREWS (4)
- 4 - INSTRUMENT PANEL TOP PAD

- (4) Remove the passenger side trim bezel from the instrument panel top pad.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Position the passenger side trim bezel to the instrument panel top pad.
- (2) From the underside of the top pad, install and tighten the four screws through the passenger airbag door that secure the passenger side trim bezel to the instrument panel (Fig. 37). Tighten the screws to 11.8 N·m (105 in. lbs.).
- (3) Reinstall the top pad onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - INSTALLATION).
- (4) Reconnect the battery negative cable.

POWER OUTLET DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the center lower bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - LOWER - REMOVAL).

POWER OUTLET DOOR (Continued)

(3) With the power outlet door in the open position, carefully spread the power outlet door hinge arms far enough to disengage the pivot pins from the pivots on the back side of the center lower bezel (Fig. 38).

NOTE: The power outlet door is more easily serviced while in the open position. The illustration shows the door in the closed position for improved visibility of the assist spring orientation and anchor point details.

800dfa78

- 1 - CENTER LOWER BEZEL
- 2 - ASH RECEIVER FLAME SHIELD
- 3 - ASH RECEIVER HOUSING
- 4 - PIVOT PINS
- 5 - ASSIST SPRING
- 6 - POWER OUTLET DOOR HINGE ARMS

(4) Disengage the stepped ends of the assist spring from the anchor holes in the inboard power outlet door hinge arm and in the side of the ash receiver housing.

(5) Remove the power outlet door from the instrument panel center lower bezel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS

IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the power outlet door to the instrument panel center lower bezel.

(2) Engage the stepped ends of the assist spring with the anchor holes in the inboard power outlet door hinge arm and in the side of the ash receiver housing (Fig. 38).

(3) With the power outlet door in the open position, carefully spread the power outlet door hinge arms far enough to engage the pivot pins with the pivots on the back side of the lower center bezel.

(4) Reinstall the center lower bezel into the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/IP CENTER BEZEL - LOWER - INSTALLATION).

(5) Reconnect the battery negative cable.

STEERING COLUMN OPENING COVER

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the fuse cover from the Junction Block (JB) and Body Control Module (BCM) unit under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - REMOVAL).

(3) Remove the cluster bezel from the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).

(4) Remove the one screw that secures the outboard end of the steering column opening cover to the U-nut on the outboard end of the instrument panel top pad (Fig. 39).

STEERING COLUMN OPENING COVER (Continued)

Fig. 39 Steering Column Opening Cover Remove/Install

- 1 - INSTRUMENT PANEL TOP PAD
 2 - STEERING COLUMN OPENING COVER
 3 - SCREW (3)

(5) Remove the two screws that secure the lower edge of the steering column opening cover to the U-nuts on the instrument panel steering column support bracket.

(6) Pull the steering column opening cover rearward to disengage the three snap clips (one outboard and two inboard) that secure it to the receptacles in the instrument panel.

(7) Remove the steering column opening cover from the instrument panel.

INSTALLATION

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING

COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Position the steering column opening cover onto the instrument panel (Fig. 39).

(2) Align the three snap clips on the steering column opening cover with their receptacles in the instrument panel.

(3) Using hand pressure, press firmly and evenly on the steering column opening cover over the snap clip locations until each of the snap clips is fully engaged in its receptacle.

(4) Install and tighten the two screws that secure the lower edge of the steering column opening cover to the instrument panel steering column support bracket. Tighten the screws to 2.2 N·m (20 in. lbs.).

(5) Install and tighten the one screw that secures the outboard end of the steering column opening cover to the U-nut on the outboard end of the instrument panel top pad. Tighten the screw to 2.2 N·m (20 in. lbs.).

(6) Reinstall the cluster bezel onto the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).

(7) Reinstall the fuse cover onto the Junction Block (JB) and Body Control Module (BCM) unit under the driver side outboard end of the instrument panel. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/FUSE COVER - INSTALLATION).

(8) Reconnect the battery negative cable.

A-PILLAR TRIM

REMOVAL

The A-pillar trim is attached to the A-pillar with spring clips.

- (1) Grasp A-pillar trim and pull trim outward from A-pillar (Fig. 1).
- (2) Separate A-pillar trim from A-pillar.

INSTALLATION

- (1) Position A-pillar trim on A-pillar and, starting at the bottom, press into place (Fig. 1).
- (2) Using a trim stick or other suitable tool, carefully cover the edge of the trim with weatherstrip.

80b574be

Fig. 1 A-Pillar Trim

- 1 - A-PILLAR TRIM
- 2 - A-PILLAR
- 3 - SPRING CLIP

ASSIST HANDLE

REMOVAL

- (1) Remove the screws holding the assist handle to the roof panel.
- (2) Remove the assist handle from the roof panel.

INSTALLATION

- (1) Align the assist handle with the screw holes in the roof panel.
- (2) Install the screws holding the assist handle to the roof panel.

B-PILLAR LOWER TRIM

REMOVAL

- (1) Remove front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Remove front seat shoulder belt anchor bolt.
- (3) Remove front seat shoulder belt height adjustment knob and turning loop.
- (4) Remove screw attaching front of quarter panel trim to floor.
- (5) Remove screws attaching front and rear of B-pillar lower trim to floor.
- (6) Remove screw attaching B-pillar lower trim to B-pillar (Fig. 2).
- (7) Grasp B-pillar lower trim and pull outward to separate from B-pillar.
- (8) Route seat/shoulder belt through access slot in B-pillar lower trim.
- (9) Separate B-pillar lower trim from B-pillar.

INSTALLATION

- (1) Position B-pillar lower trim panel at B-pillar (Fig. 2).
- (2) Route seat/shoulder belt through access slot in B-pillar lower trim.
- (3) Press B-pillar lower trim onto B-pillar.
- (4) Install screw attaching B-pillar lower trim to B-pillar.
- (5) Install screw attaching front of B-pillar lower trim to floor.
- (6) Install screw attaching front of quarter panel trim to floor.
- (7) Install front seat shoulder belt anchor bolt.
- (8) Install front seat shoulder belt height adjustment knob and turning loop.
- (9) Install front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

B-PILLAR UPPER TRIM

REMOVAL

- (1) Remove shoulder belt height adjustment knob.
- (2) Remove front seat belt turning loop.
- (3) Remove the screw attaching lower B pillar trim.
- (4) Pull lower B pillar trim out far enough to remove upper trim panel.
- (5) Grasp upper B-pillar trim and pull outward to detach from B-pillar (Fig. 2).

INSTALLATION

- (1) Position trim panel on B-pillar (Fig. 2).
- (2) Ensure trim panel covers inner edge of door opening weatherstrip and press inward to seat.
- (3) Install screw attaching lower B pillar trim panel.
- (4) Install front seat belt turning loop.
- (5) Install shoulder belt height adjustment knob.

CARPETS AND FLOOR MATS

REMOVAL - FRONT CARPET

- (1) Remove door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).
- (2) Remove the B-pillar lower trim, refer to (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
- (3) Remove front seats (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
- (4) Remove the rear seats lower cushions (Refer to 23 - BODY/SEATS/SEAT CUSHION - REMOVAL).
- (5) Remove center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
- (6) Remove any other interfering trim or molding.
- (7) Lift carpet and mat from floor panel.

REMOVAL - CARGO AREA CARPET

- (1) Lift tailgate.
- (2) Fold rear seat cushions forward.
- (3) Remove rear seat backs (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (4) Remove the rear shoulder belts (Refer to 8 - ELECTRICAL/RESTRAINTS/REAR SEAT BELT & RETRACTOR - REMOVAL).
- (5) Remove the retractable security cargo cover assembly.
- (6) Remove the spare tire cover.

CARPETS AND FLOOR MATS (Continued)

80b34ee7

Fig. 2 B-Pillar Trim Panel

- 5 - COWL LOWER TRIM

- 6 - CLIP
- 7 - SCUFF PLATE
- 8 - SILL TRIM
- 9 - A-PILLAR TRIM

CARPETS AND FLOOR MATS (Continued)

(7) Remove the rear cargo tie down footman loops. The side mounted footman loops are retained by screws. The floor footman loops are riveted (Fig. 3).

(8) Remove the C pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).

(9) Remove the CD changer, if equipped (Refer to 8 - ELECTRICAL/AUDIO/CD CHANGER - REMOVAL).

(10) Remove the Infinity amp, if equipped (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - REMOVAL).

(11) Lift the carpet.

Fig. 3 Cargo Area Carpet

- 1 - CARGO AREA CARPET
- 2 - RIVET
- 3 - CARGO TIE-DOWN LOOP

INSTALLATION - FRONT CARPET

(1) Carefully lay the carpet and mat on the floor panel. Align the carpet to allow installation of the components fastened to the floor panel.

(2) Install the center console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

(3) Install the front seats (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

(4) Install the rear seat cushions (Refer to 23 - BODY/SEATS/SEAT CUSHION - INSTALLATION).

(5) Install the lower B pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).

(6) Install the door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

(7) Install any other moldings or trim panels removed.

INSTALLATION - CARGO AREA CARPET

(1) Thoroughly clean the area with Mopar Super Kleen®, or equivalent.

(2) Lay the new carpet in.

(3) Install the "C" pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

(4) Install the CD changer, if equipped (Refer to 8 - ELECTRICAL/AUDIO/CD CHANGER - INSTALLATION).

(5) Install the footman loops (Fig. 3).

(6) Install the rear shoulder belts (Refer to 8 - ELECTRICAL/RESTRAINTS/REAR SEAT BELT & RETRACTOR - INSTALLATION).

(7) Install the rear seat backs (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

(8) Install the Infinity amp, if equipped (Refer to 8 - ELECTRICAL/AUDIO/AMPLIFIER - INSTALLATION).

(9) Install the spare tire cover.

(10) Install the retractable security cover.

COWL TRIM

REMOVAL

(1) Remove front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - REMOVAL).

(2) Remove screws attaching cowl trim to floor.

(3) Remove plastic nut.

(4) Grasp cowl trim and pull outward to separate from clip.

(5) Separate cowl trim from vehicle.

INSTALLATION

(1) Position cowl trim and press into place.

(2) Install screws attaching cowl trim to floor.

(3) Install plastic nut.

(4) Install front door sill trim (Refer to 23 - BODY/INTERIOR/DOOR SILL TRIM - INSTALLATION).

COWL TRIM (Continued)

- 7 - BRACKET
- 8 - B-PILLAR LOWER TRIM
- 9 - C-PILLAR UPPER TRIM
- 10 - SNAP-IN NUT

C-PILLAR TRIM**REMOVAL**

- (1) Remove rear shoulder belt turning loop.
- (2) Remove rear shoulder belt height adjustment knob.
- (3) Remove screws attaching quarter panel trim.
- (4) Pull quarter panel trim outward as necessary.
- (5) Grasp C-pillar upper trim and pull outward to disengage from C-pillar (Fig. 4).
- (6) Route rear shoulder belt through access hole.
- (7) Separate C-pillar upper trim from vehicle.

INSTALLATION

- (1) Position C-pillar upper trim at C-pillar (Fig. 4).
- (2) Route rear shoulder belt through access hole.
- (3) Press C-pillar upper trim onto C-pillar.
- (4) Press quarter panel trim into place as necessary.
- (5) Ensure front edge of trim is covered by weatherstrip.
- (6) Install screws attaching quarter panel trim.
- (7) Install rear shoulder belt height adjustment knob.
- (8) Install rear shoulder belt turning loop.

DOOR SILL SCUFF PLATE

REMOVAL

- (1) Using a trim stick or other suitable tool, carefully pry up the scuff plate from the door sill (Fig. 5).
- (2) Remove the scuff plate.

80ba797a

Fig. 5 Door Sill Scuff Plates

- 1 - B-PILLAR
- 2 - FRONT DOOR SCUFF PLATE
- 3 - REAR DOOR SCUFF PLATE

INSTALLATION

- (1) Install the scuff plate on the door sill (Fig. 5).
- (2) Press the molded in snap retainers into the door sill.

DOOR SILL TRIM

REMOVAL

The sill trim molding is held in place with molded in snap retainers (Fig. 6).

- (1) Using a trim stick or other suitable device, carefully pry up one corner of the sill trim.
- (2) Grasp the edge of the trim and pull up gently to release the snap retainers.

INSTALLATION

- (1) Position the sill molding on the door sill.
- (2) Press the snap retainers into place.

D-PILLAR TRIM

REMOVAL

The D-pillar trim is attached to the D-pillar with spring clips (Fig. 7).

- (1) Remove liftgate opening upper trim panel (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
- (2) Grasp D-pillar trim and pull outward from D-pillar.
- (3) Separate D-pillar trim from D-pillar.

INSTALLATION

- (1) Position D-pillar trim panel at D-pillar and press into place.
- (2) Install upper liftgate opening trim panel (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

FLOOR CONSOLE

REMOVAL

CAUTION: The ACM should be depowered by disconnecting the negative battery cable in any operation requiring the key to be turned "ON", while working in the console area. E.G. console, carpet, or seat removal or installation; shifter linkage adjustment or replacement; parking brake cable replacement or adjustment. Failure to take proper precautions could result in accidental airbag deployment and possible personal injury.

- (1) Set park brake.
- (2) Place transmission shift lever and transfer case lever in full rearward position.

FLOOR CONSOLE (Continued)

Fig. 8 Floor Console

- 1 - REAR BIN
2 - CONSOLE LID
3 - SHIFTER CONSOLE
4 - BRACKET

- (3) Remove mat from front bin and remove screws attaching front of console to floor (Fig. 8).
- (4) Remove screws attaching rear bin to console.
- (5) Remove rear bin.
- (6) Pull rear passenger cupholder outward to access screws.
- (7) Remove screws attaching rear of console to floor.
- (8) Lift the console upward and rearward.
- (9) Remove console from vehicle.

INSTALLATION

CAUTION: The ACM should be depowered by disconnecting the negative battery cable in any operation requiring the key to be turned “ON”, while working in the console area. E.G. console, carpet, or seat removal or installation; shifter linkage adjustment or replacement; parking brake cable replacement or adjustment. Failure to take proper precautions could result in accidental airbag deployment and possible personal injury.

HEADLINER

REMOVAL

CAUTION: The headliner is a one-piece, molded component. It has limited flexibility and must not be bent. Damage may possibly result.

- (1) Record radio presets and disconnect negative battery cable.
- (2) Remove A pillar trim moldings (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

HEADLINER (Continued)

(3) Remove B pillar upper trim moldings (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).

(4) Remove C pillar trim moldings (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).

(5) Remove D pillar trim molding (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).

(6) Remove the sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - REMOVAL).

(7) Disconnect the vanity lamp electrical connector.

(8) Remove assist handles from roof rails (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - REMOVAL).

(9) Remove dome lamp and overhead console, if equipped.

(10) Remove rear cargo/dome lamp.

(11) Remove sun roof pinch welt, if equipped.

(12) Disengage rear washer hose from liftgate (Fig. 9).

(13) Disengage the wire harness connectors at rear of headliner.

(14) Disconnect the rear washer hose at the left "A" pillar (Fig. 10).

(15) Disengage the wire harness for the sunroof, if equipped.

(16) Fold down the rear seats, move the front seats full forward, and lower the front seat backs.

(17) Partially lower the headliner and disengage the sunroof drain hoses, if equipped (Fig. 11).

(18) With the aid of an assistant, remove the headliner through the liftgate opening.

INSTALLATION

(1) With the aid of an assistant, position the headliner in the vehicle.

(2) Connect the sunroof drain hoses, if equipped.

(3) Connect the sunroof harness, the rear wire harnesses, and the washer hose at the "A" pillar and at the liftgate.

(4) Install the sunroof pinch welt, if equipped.

(5) Install the roof rail assist handles (Refer to 23 - BODY/INTERIOR/ASSIST HANDLE - INSTALLATION).

(6) Install the sun visors (Refer to 23 - BODY/INTERIOR/SUN VISOR - INSTALLATION).

(7) Install the overhead console, if equipped.

(8) Install the rear cargo/dome lamp.

(9) Install the D pillar trim (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

(10) Install the C pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

(11) Install the upper B pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

(12) Install the A pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

(13) Connect the negative battery cable.

LIFTGATE OPENING UPPER TRIM

REMOVAL

The upper liftgate opening trim is held on with spring clips.

- (1) Grasp the rear of the trim piece and pull down and back to disengage clips (Fig. 12).
- (2) Slide the trim piece to the rear to disengage headliner locating hooks.

INSTALLATION

The liftgate upper opening trim piece is equipped with headliner locating hooks (Fig. 13).

- (1) Align the locating hooks with the slots in the headliner.
- (2) Engage the spring clips and press the liftgate upper opening trim panel into place.

**Fig. 12 Upper Liftgate Opening Trim**

- 1 - UPPER LIFTGATE OPENING TRIM

LIFTGATE OPENING UPPER TRIM (Continued)

80bdbce9

Fig. 13 Headliner Locating Hooks

1 - UPPER LIFTGATE OPENING TRIM

2 - HEADLINER

QUARTER TRIM PANEL

REMOVAL

- (1) Move rear seat to cargo position.
- (2) If equipped, remove sunshade cover.
- (3) Open liftgate.
- (4) Remove upper and lower liftgate opening trim panels (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
- (5) Remove D-pillar upper trim (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
- (6) Remove storage bin (right side only) (Refer to 23 - BODY/INTERIOR/REAR STORAGE BOX - REMOVAL).
- (7) Remove C-pillar upper trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
- (8) Remove mounting screws.
- (9) Pull quarter trim panel forward and disengage connectors for CD player and power outlet, if equipped.
- (10) Pull quarter trim panel extension in the rear door opening upward.
- (11) Remove rear quarter trim panel.

INSTALLATION

- (1) Position quarter trim panel, engage connectors for CD player and power outlet, if equipped, and align screw holes.
- (2) Install quarter trim panel.
- (3) Install C-pillar upper trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
- (4) Install storage bin (Refer to 23 - BODY/INTERIOR/REAR STORAGE BOX - INSTALLATION).

(5) Install D-pillar upper trim panel (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).

(6) Install upper and lower liftgate opening trim panels (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

(7) If equipped, install sunshade cover.

(8) Install cargo loops.

(9) Move the rear seat to the upright position.

REAR STORAGE BOX

REMOVAL

- (1) Open the storage bin lid and remove screws on each side of the lid hinge.
- (2) Pull upward sharply on the bottom of the bin to disengage hooks.
- (3) Raise bin and move inboard to disengage the quarter trim panel.

INSTALLATION

- (1) Position the bin hooks high in the slots on the quarter trim panel.
- (2) Push downward until the bin snaps into place.
- (3) Install the hinge screws.

REAR VIEW MIRROR

REMOVAL

- (1) If equipped, disconnect mirror harness connector.
- (2) Loosen the mirror base setscrew (Fig. 14).
- (3) Slide the mirror base upward and off the bracket.

INSTALLATION

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket (Fig. 14).
- (2) Tighten the setscrew 1 N·m (15 in. lbs.) torque.
- (3) If equipped, connect mirror harness connector.

INSTALLATION - REARVIEW MIRROR SUPPORT BRACKET

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
- (3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.

REAR VIEW MIRROR (Continued)

**Fig. 14 Rearview Mirror**

- 1 - CONNECTOR
 2 - SCREW
 3 - ELECTROCHROMATIC REAR VIEW MIRROR
 4 - SUPPORT BUTTON
 5 - WINDSHIELD

(4) Apply accelerator to the surface on the bracket according to the following instructions:

- Crush the vial to saturate the felt applicator.
 - Remove the paper sleeve.
 - Apply accelerator to the contact surface on the bracket.
 - Allow the accelerator to dry for five minutes.
 - Do not touch the bracket contact surface after the accelerator has been applied.
- (5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
- (6) Install the bracket according to the following instructions:
- Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.

(b) Apply an even coat of adhesive to the contact surface on the bracket.

(c) Align the bracket with the marked position on the windshield glass.

(d) Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.

(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

SUN VISOR

REMOVAL

- Remove screws attaching sunvisor arm support bracket to headliner and roof panel.
- Disengage electrical connections for vanity mirror, if equipped.
- Detach sunvisor from support bracket.
- Remove sunvisor from vehicle.
- Remove retaining screw and support bracket.

INSTALLATION

- Install the retaining screw and support bracket.
- Position the sunvisor in the vehicle.
- Connect the electrical harness for the lighted vanity mirror, if equipped.
- Attach the sunvisor to the support bracket.
- Install the support bracket w/sunvisor onto the headliner and roof panel.

BASE COAT/CLEAR COAT FINISH

DESCRIPTION

The original equipment finish is a multi-step process that involves cleaning, electrodeposition (e-coat), base coat, and clear coat steps. Additionally, selected areas of the vehicle may be coated with an anti-chip finish.

PAINT CODE

DESCRIPTION

Exterior vehicle body colors are identified on the Body Code plate. The plate is located on the in the engine compartment and attached to the top of the right frame rail. Refer to the Introduction section at the front of this manual for body code plate description. The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat.

PAINT TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. Refer to Introduction group of this manual for Body Code Plate information.

WARNING:

USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

PAINT TOUCH-UP (Continued)

OPERATION

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clear coat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

WARNING:

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

WET SANDING/BUFFING & POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.

SEATS

DESCRIPTION

Seat modules are made up of a seat frame, seat cushion, seat back cushion, a covering material, and the electrical components used for power operation, if equipped. Some seat systems also contain seat belt components and supplemental restraint systems.

OPERATION

Seat assemblies transport the occupants in comfort and safety. Seat assemblies also help position occupants correctly in the event of airbag deployment. Seat cushions, coverings, and electrical components are serviceable. Refer to the appropriate group in this manual.

FRONT HEADREST

REMOVAL

(1) Depress head restraint release button and lift head restraint to full up position.

(2) Using a small flat blade, depress tab on right side head restraint release button and using your hand, simultaneously press tab on left side head restraint release button (Fig. 1) and pull head restraint up to separate from seat back.

FRONT HEADREST (Continued)

**Fig. 1 Head Restraint**

- 1 - HEAD RESTRAINT
2 - FLAT BLADE

INSTALLATION

(1) Position head restraint in seat back, press tab on left side head restraint release button and push down head restraint to secure.

FRONT HEADREST SLEEVE

REMOVAL

- (1) Remove head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - REMOVAL).
- (2) Remove seat back cover (Refer to 23 - BODY/SEATS/FRONT SEAT BACK COVER - REMOVAL).
- (3) Remove hog rings attaching cushion pad to seat back frame (Fig. 2).
- (4) Remove cushion pad from seat back frame.
- (5) Rotate head restraint sleeve 1/4 turn counter-clockwise to release retaining tab.
- (6) Pull sleeve from seat back frame (Fig. 3).

INSTALLATION

- (1) Position sleeve in seat back frame.
- (2) Rotate head restraint sleeve 1/4 turn clockwise to engage retaining tab.
- (3) Install cushion pad onto seat back frame.
- (4) Install hog rings attaching cushion pad to seat back frame.
- (5) Install seat back cover (Refer to 23 - BODY/SEATS/FRONT SEAT BACK COVER - INSTALLATION).
- (6) Install head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - INSTALLATION).

**Fig. 2 Cushion Pad**

- 1 - HOG RING
2 - SEAT BACK CUSHION PAD

**Fig. 3 Head Restraint Sleeve**

- 1 - HEAD RESTRAINT SLEEVE
2 - SEAT BACK FRAME
3 - RETAINING TAB

FRONT SEAT

REMOVAL

- (1) Move seat to full rearward position.
- (2) Remove front bolts attaching seat to floor pan (Fig. 4).
- (3) Move seat to full forward position.
- (4) Using a trim stick, pry cover from seat track (power seat only).
- (5) Remove rear bolts attaching seat to floor pan.
- (6) If equipped, disconnect power seat wire harness connector.
- (7) Remove seat from vehicle.

Fig. 4 Front Bucket Seat

- 1 - POWER BUCKET SEAT
2 - FLOOR PAN
3 - SEAT TRACK COVER

INSTALLATION

- (1) Position seat on floor pan.
- (2) If equipped, connect power seat wire harness connector.
- (3) Install rear bolts attaching seat to floor pan. Tighten bolts to 40 N·m (30 ft. lbs.) torque.

- (4) If equipped, install cover on seat track.
- (5) Move seat to full rearward position.
- (6) Install front bolts attaching seat to floor pan. Tighten bolts to 40 N·m (30 ft. lbs.) torque.

FRONT SEAT BACK

REMOVAL

- (1) Move seat to full rearward position.
- (2) Remove inboard bolt attaching seat back frame to seat cushion frame.
- (3) Move seat to full forward position.
- (4) Move seat back to full recline position.
- (5) Remove screws attaching seat side shield to seat frame.
- (6) Disconnect wire harness connector from recliner motor, if equipped.
- (7) From the underside of the seat, disconnect the wire harness connector for the power lumbar and/or heated seat, if equipped.
- (8) Remove outboard bolts attaching recliner to seat cushion frame.
- (9) Route the power lumbar and/or heated seat harness through the seat cushion cover, if equipped.
- (10) Separate seat back from seat cushion.

INSTALLATION

- (1) Position seat back on seat cushion.
- (2) Route the power lumbar and heater harness through the seat cushion cover, if equipped.
- (3) Install recliner bolts attaching seat back frame to seat cushion frame. Tighten bolts to 28 N·m (20 ft. lbs.) torque.
- (4) Install the inboard bolt attaching seat back frame to seat cushion frame. Tighten bolt to 47N·m (35 ft.lbs.).
- (5) Connect wire harness connector to recliner motor and/or heated seat, if equipped.
- (6) From the underside of the seat, connect the power lumbar and/or heated seat wire harness connector to the seat harness, if equipped.
- (7) Install screws attaching seat side shield to seat frame.

FRONT SEAT BACK COVER

REMOVAL

- (1) Remove head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - REMOVAL).
- (2) Using a trim stick, carefully pry head restraint release button caps from the top of seat back.
- (3) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (4) Disengage J-strap at base of seat back.
- (5) Slide hand between the face of the seat back pad and the cushion cover and carefully separate hook and loop fastener (Fig. 5).
- (6) Roll cover upward and disengage hog rings.
- (7) Roll cover upward to top of seat back.
- (8) Separate cover from seat back.

Fig. 5 Seat Back Cover

- 1 - SEAT BACK COVER
2 - HOOK AND LOOP FASTENER
3 - SEAT BACK PAD

INSTALLATION

- (1) Position cover inside-out at the top of seat back.
- (2) Roll cover downward.
- (3) Engage hog rings.
- (4) Align seat back cover with hook and loop fasteners and secure.
- (5) Roll cover downward.
- (6) Engage J-strap at base of seat back.
- (7) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

NOTE: The taller head restraint release button cap is positioned on the left hand side and the head restraint button cap with the hidden button is positioned on the right hand side.

- (8) Position head restraint release button caps on head restraint sleeves and press to secure.
- (9) Install head restraint (Refer to 23 - BODY/SEATS/FRONT HEADREST - INSTALLATION).

FRONT SEAT CUSHION

REMOVAL

- (1) Remove seat from vehicle (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL).
- (2) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (3) Disengage J-straps attaching cushion cover to seat cushion frame.
- (4) Disengage hog rings attaching cushion cover to cushion frame at rear of seat along bottom of cushion cover (Fig. 6).
- (5) Roll up edges of cover and route seat function switches through access hole on outboard side of seat cushion, if equipped.
- (6) Disengage seat cushion heater element connector, if equipped.
- (7) Disengage hog rings attaching cover to cushion along cover insert.
- (8) Separate seat cushion cover from seat cushion.

Fig. 6 Seat Cushion Cover

- 1 - HOG RING
2 - CUSHION COVER

INSTALLATION

- (1) Position seat cover on cushion.
- (2) Engage hog rings attaching cushion cover to cushion along insert.
- (3) Engage seat cushion heater element connector, if equipped.
- (4) Route seat function switches through access hole on outboard side of seat cushion, if equipped.

FRONT SEAT CUSHION (Continued)

- (5) Engage J-straps attaching cushion cover to seat cushion frame.
- (6) Engage hog rings attaching cushion cover to cushion frame.
- (7) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).
- (8) Install seat (Refer to 23 - BODY/SEATS/FRONT SEAT - INSTALLATION).

FRONT SEAT SIDE SHIELD

REMOVAL

- (1) Remove screws attaching side shield to seat frame.
- (2) Disconnect wire harness connectors from power seat and power lumbar switches, if equipped.
- (3) Separate side shield from seat.

INSTALLATION

- (1) Position side shield on seat.
- (2) Connect wire harness connectors to power seat and power lumbar switches, if equipped.
- (3) Install screws attaching side shield to seat frame.

SEAT TRACK & RECLINER ASSEMBLY

REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - REMOVAL).
- (2) Disengage J-strap at base of seat back.
- (3) Roll seat back cover upward to access bolts attaching recliner to seat back frame.
- (4) Remove bolts attaching recliner to seat back frame.
- (5) Separate recliner from seat back.

INSTALLATION

- (1) Position recliner on seat back.
- (2) Install bolts attaching recliner to seat back frame. Tighten bolts to 28 N·m (20 ft. lbs.) torque.
- (3) Roll seat back cover downward.
- (4) Engage J-strap at base of seat back.
- (5) Install seat back (Refer to 23 - BODY/SEATS/FRONT SEAT BACK - INSTALLATION).

SEAT TRACK ADJUSTER

REMOVAL

- (1) Remove seat (Refer to 23 - BODY/SEATS/FRONT SEAT - REMOVAL).

- (2) Remove side shield (Refer to 23 - BODY/SEATS/FRONT SEAT SIDE SHIELD - REMOVAL).
- (3) Remove nuts attaching seat track adjuster to seat cushion frame (Fig. 7) and (Fig. 8). Roll cushion trim cover up to access the two front nuts.
- (4) Disengage clips attaching wire harness to adjuster.
- (5) Disengage seat memory module connector, if equipped.
- (6) Separate seat track from seat cushion frame.

80ba7810

Fig. 7 Seat Track Adjuster—Power

- 1 - BACK PANEL
- 2 - LUMBAR ASSEMBLY
- 3 - SEAT CUSHION FRAME
- 4 - POWER SEAT TRACK ADJUSTER
- 5 - POWER RECLINER
- 6 - SEAT CUSHION PAD
- 7 - SEAT BACK FRAME

INSTALLATION

- (1) Transfer seat memory module, if equipped.
- (2) Position seat track on seat cushion frame.

SEAT TRACK ADJUSTER (Continued)

80b6f0aa

Fig. 8 Seat Track Adjuster — Manual

- 1 - MANUAL RECLINER
- 2 - SEAT CUSHION PAD
- 3 - SEAT BACK FRAME
- 4 - SEAT CUSHION FRAME
- 5 - MANUAL SEAT TRACK ADJUSTER

(3) Route harness through frame and engage clips attaching wire harness to adjuster.

(4) Engage seat memory module connector, if equipped.

(5) Install nuts attaching seat track adjuster to seat cushion frame. Tighten nuts to 28 N·m (20 ft. lbs.) torque.

(6) Install the side shield (Refer to 23 - BODY/SEATS/Front Seat Side Shield - Installation).

(7) Install seat (Refer to 23 - BODY/SEATS/Front Seat - Installation).

REAR HEADREST

REMOVAL

(1) Depress head rest release button and lift head rest to full up position.

(2) Using a small flat blade, depress tab on out-board side head rest release button and using your hand, simultaneously press tab on inboard side head rest release button (Fig. 9) and pull head rest up to separate from seat back.

80b6f0a7

Fig. 9 Head Rest

- 1 - HEAD RESTRAINT
- 2 - FLAT BLADE

INSTALLATION

(1) Position head rest in seat back, press tab on inboard side head rest release button cap and push down head restraint to secure.

REAR HEADREST RELEASE KNOB

REMOVAL

(1) Using a razor knife or equivalent, cut the release knob from the release lever.

(2) Pull the release knob from the lever (Fig. 10).

INSTALLATION

(1) Position the release knob on the lever and press to snap in place.

REAR HEADREST FOLDING MECHANISM

REMOVAL

- (1) Remove the head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).
- (2) Remove folding mechanism cover (Fig. 10).
- (3) Remove the screws that secure the head rest bun to the folding mechanism.

Fig. 10 Rear Seat Head Rest Folding Mechanism

- 1 - REAR SEAT HEAD REST FOLDING MECHANISM
2 - RELEASE KNOB
3 - FOLDING MECHANISM COVER

NOTE: The folding release knob is always located on the outboard side.

INSTALLATION

- (1) Position the head rest bun on the folding mechanism and install the screws.
- (2) Install the folding mechanism cover.
- (3) Install the head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).

REAR HEADREST SLEEVE

REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Remove head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).

- (3) Remove head rest caps.
- (4) Remove seat back cover (Refer to 23 - BODY/SEATS/REAR SEAT BACK COVER - REMOVAL).
- (5) Rotate head rest sleeve 1/4 turn counter-clockwise to release retaining tab.
- (6) Pull sleeve from seat back frame.

INSTALLATION

- (1) Position sleeve in seat back frame.
- (2) Rotate head rest sleeve 1/4 turn clockwise to engage retaining tab.
- (3) Install seat back cover (Refer to 23 - BODY/SEATS/REAR SEAT BACK COVER - INSTALLATION).
- (4) Install head rest caps.

NOTE: The head rest cap with the taller button is always on the inboard side of the seat back.

- (5) Install the head rest (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).

NOTE: The folding head rest release knob is always on the outboard side.

- (6) Install the seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

REAR SEAT BACK

REMOVAL

- (1) Move rear seat cushions to forward cargo position.
- (2) Remove bolts attaching seatback side support bracket to floor pan (right side) (Fig. 11).
- (3) Tilt seatback forward, and slide it outboard to detach it from pin on center pivot bracket.
- (4) Remove right side (60%) seatback from vehicle.
- (5) Remove bolts attaching seatback side support bracket and center pivot bracket to floor pan (left side).
- (6) Remove left side (40%) seatback from vehicle.

INSTALLATION

- (1) Position left side (40%) seatback in vehicle.
- (2) Position left side support bracket and center pivot bracket with bolt holes aligned and install bolts. Tighten bolts to 28 N·m (20 ft. lbs.) torque.
- (3) Position right side (60%) seatback in vehicle.
- (4) Install seatback onto center pivot bracket pin. Ensure seat back is properly engaged on the center pivot pin.
- (5) Position right side support bracket with bolt holes aligned and install bolts. Tighten bolts to 28 N·m (20 ft. lbs.) torque.
- (6) Return seat cushions to seating position.

REAR SEAT BACK (Continued)

**Fig. 11 Rear Seat Back**

- 1 - SEAT BACK
- 2 - FLOOR PAN
- 3 - CENTER PIVOT BRACKET
- 4 - SIDE SUPPORT BRACKET

REAR SEAT BACK COVER

REMOVAL

- (1) Remove seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - REMOVAL).
- (2) Remove head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - REMOVAL).
- (3) Remove head restraint caps.
- (4) Disengage J-straps on outboard side of seat back.
- (5) Disengage J-straps at base of seat back.
- (6) Remove screws attaching latch release handle to seat back frame.
- (7) Roll seat back cover upward.
- (8) Disengage hook and loop fasteners attaching seat back cover to seat back pad (Fig. 12).
- (9) Roll seat back cover upward and route latch release handle through seat back cover.
- (10) Separate seat back cover from seat back.
- (11) Separate seat back pad from seat back frame.

INSTALLATION

- (1) Position seat back cover and pad on seat back frame.
- (2) Route latch release handle through seat back cover.

**Fig. 12 Rear Seat Back Cover**

- 1 - SEAT BACK COVER
- 2 - SEAT BACK PAD
- 3 - HOOK AND LOOP FASTENER

(3) Roll seat back cover partially downward aligning holes in seat back cover for head restraint and latch release handle.

(4) Roll seat back cover downward align and engage hook and loop fasteners to seat back pad.

(5) Engage J-straps at base of seat back.

(6) Engage J-straps on outboard side of seat back.

(7) Install screws attaching latch release handle to seat back frame.

(8) Install head restraint (Refer to 23 - BODY/SEATS/REAR HEADREST - INSTALLATION).

(9) Install seat back (Refer to 23 - BODY/SEATS/REAR SEAT BACK - INSTALLATION).

REAR SEAT CUSHION

REMOVAL

- (1) Disengage seat cushion at rear by pulling upward on release strap.
- (2) Remove bolts attaching seat cushion to floor pan (Fig. 13).
- (3) Remove seat cushion from vehicle.

INSTALLATION

- (1) Position seat cushion in vehicle.
- (2) Install bolts attaching seat cushion to floor pan. Tighten bolts to 11 N·m (8 ft. lbs.) torque.
- (3) Lock seat cushion down by pressing firmly on center of cushion until latch engages.

REAR SEAT CUSHION (Continued)

**Fig. 13 Rear Seat Cushion**

- 1 - SEAT CUSHION
2 - FLOOR PAN

REAR SEAT CUSHION COVER

REMOVAL

- (1) Remove rear seat cushion (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - REMOVAL).
- (2) From the underside of the seat, disengage J-straps attaching cover to seat cushion base panel.
- (3) Remove push-in fasteners attaching cushion cover to seat cushion base panel (Fig. 14).
- (4) Roll back cover.
- (5) Disengage hog rings attaching cushion cover to seat cushion foam pad.
- (6) Separate cushion cover from seat cushion foam pad.

**Fig. 14 Push-in Fasteners**

- 1 - CUSHION COVER
2 - SEAT CUSHION BASE PANEL
3 - PUSH-IN FASTENER

INSTALLATION

- (1) Position cushion cover on seat cushion foam pad.
- (2) Engage hog rings attaching cushion cover to seat cushion foam pad.
- (3) Align cushion cover and engage J-straps attaching cushion cover to seat cushion base panel.
- (4) Install push-in fasteners attaching cushion cover to seat cushion base panel.
- (5) Install rear seat cushion (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION - INSTALLATION).

FOLDING REAR SEAT BACK LATCH / LOCK

REMOVAL

- (1) Unlatch seat and pivot seat upward.
- (2) Disengage J-strap at seat cushion base panel.
- (3) Roll back cushion cover.
- (4) Remove screws attaching latch to base panel.
- (5) Separate latch from base panel.

INSTALLATION

- (1) Position latch on base panel.
- (2) Install screws attaching latch to base panel. Tighten screws to 8 N·m (75 in. lbs.) torque.
- (3) Route the cushion release strap from the loop on the latch through the slot in the trim cover.
- (4) Engage J-strap at seat cushion base panel.
- (5) latch seat.

FOLDING REAR SEAT BACK LATCH HANDLE

REMOVAL

- (1) Pull handle to release latch.
- (2) Remove screws attaching release handle to seat back frame.
- (3) Using a small flat blade, disengage retainers securing latch release cable housing to latch release handle.
- (4) Rotate cable end until barrel end aligns with key hole slot in latch release handle.
- (5) Disengage cable barrel end from release handle.
- (6) Separate latch release handle from seat back (Fig. 15).

INSTALLATION

- (1) Route cable end into latch release handle.
- (2) Rotate cable end until barrel end aligns with key hole slot in latch release handle and insert into handle.

FOLDING RR SEAT BK LATCH HANDLE (Continued)

80ba780a

Fig. 15 Rear Seat Release Handle

1 - REAR SEAT FOLDING RELEASE HANDLE

(3) Engage retainers securing latch release cable housing to latch release handle.

(4) Position latch release handle in seat back. Ensure seat back cover is properly aligned.

(5) Install screws attaching release handle to seat back frame.

FOLDING REAR SEAT BACK LATCH/HINGE

REMOVAL

(1) Remove seat back (Refer to 23 - BODY/SEATS/ REAR SEAT BACK - REMOVAL).

(2) Disengage J-straps on outboard side of seat back.

(3) Disengage release cable from latch.

(4) Remove bolts attaching latch/hinge to seat back frame.

(5) Separate latch/hinge from seat back frame.

INSTALLATION

(1) Position latch/hinge on seat back frame.

(2) Install bolts attaching latch/hinge to seat back frame. Tighten bolts to 28 N·m (20 ft. lbs.) torque.

(3) Engage latch release cable.

(4) Engage J-straps on outboard side of seat back.

(5) Install seat back (Refer to 23 - BODY/SEATS/ REAR SEAT BACK - INSTALLATION).

QUARTER WINDOW			
REMOVAL.....	183		

STATIONARY GLASS

DESCRIPTION

Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

OPERATION

Windshields are made of two pieces of glass with a plastic inner layer. Windshields and other stationary glass protect the occupants from the effects of the elements. Windshields are also used to retain some airbags in position during deployment. Urethane bonded glass is difficult to salvage during removal. The urethane bonding is difficult to cut or clean from any surface. Before removing the glass, check the availability of replacement components.

DOOR GLASS

REMOVAL

- (1) Remove door trim panel.
- (2) Remove waterdam.
- (3) Remove inner belt weatherstrip.
- (4) Remove bolt attaching bottom of rear glass run channel to door.
- (5) Pull run channel downward and separate from door.
- (6) Remove screws attaching stationary door glass frame to door (Fig. 1) and (Fig. 2).
- (7) Separate stationary door glass from door.

INSTALLATION

- (1) Position stationary door glass in door.
- (2) Install screws attaching stationary door glass frame to door.
- (3) Install glass run channel.

80b46b2c

Fig. 1 Stationary Door Glass

- 1 - DOOR
- 2 - STATIONARY DOOR GLASS

80b46b2b

Fig. 2 Stationary Door Glass

- 1 - STATIONARY DOOR GLASS
- 2 - DOOR

DOOR GLASS (Continued)

- (4) Install inner belt weatherstrip.
- (5) Install waterdam.
- (6) Install door trim panel.

QUARTER WINDOW

REMOVAL

- (1) Cut urethane bonding from around quarter window glass using a suitable sharp cold knife. A pneumatic cutting device can be used if available.
- (2) Separate glass from vehicle.

INSTALLATION

CAUTION: Open a window before installing glass. This will avoid pressurizing the passenger compartment. If a door or liftgate is slammed before urethane is cured, water leaks can result.

The window opening fence should be cleaned of old urethane bonding material.

- (1) Clean inside of glass with Mopar Glass Cleaner and lint-free cloth.
 - (2) Apply PVC (vinyl) primer 25 mm (1 in.) wide around edge of glass. Wipe with clean/dry lint-free cloth.
 - (3) Apply fence primer around edge of fence. Allow at least eighteen minutes drying time.
 - (4) Apply a 10 mm (0.4 in.) bead of urethane around window vinyl border location.
- Position glass into window opening and lock clips into place (Fig. 3).

Fig. 3 Quarter Window Glass

- 1 - CLIP
- 2 - ROOF PANEL
- 3 - QUARTER WINDOW GLASS

WINDSHIELD

DESCRIPTION

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

OPERATION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

WINDSHIELD (Continued)

80500535

Fig. 4 Windshield

- 1 - SIDE MOLDING
- 2 - SUPPORT SPACER
- 3 - UPPER MOLDING
- 4 - SIDE MOLDING
- 5 - ROOF PANEL
- 6 - SUPPORT SPACER

- 7 - BLOCKER
- 8 - STUD
- 9 - SUPPORT SPACER
- 10 - WINDSHIELD
- 11 - ALIGNMENT SPACER

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

REMOVAL

- (1) Remove inside rear view mirror.
- (2) Remove cowl cover.
- (3) Remove screws attaching windshield side molding to A-pillar (Fig. 4).
- (4) Remove upper windshield molding.
- (5) Cut urethane bonding from around windshield using a suitable sharp cold knife. A pneumatic cutting device can be used if available (Fig. 5).
- (6) Separate windshield from vehicle.

9123-129

Fig. 5 Cut Urethane Around Windshield—Typical

- 1 - COLD KNIFE
- 2 - WINDSHIELD

WINDSHIELD (Continued)

INSTALLATION

WARNING: REVIEW ALL WARNINGS AND CAUTIONS IN THIS GROUP BEFORE PRECEDING WITH INSTALLATION.

CAUTION: Open a window before installing windshield. This will avoid pressurizing the passenger compartment. If a door or liftgate is slammed before urethane is cured, water leaks can result.

The windshield fence should be cleaned of old urethane bonding material. Support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

(1) Place replacement windshield into windshield opening. Position glass in the center of the opening against the support spacers. Mark the glass at the support spacers with a grease pencil or masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 6).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 7).

(3) Clean inside of windshield with Mopar Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around edge of windshield. Wipe with clean/dry lint-free cloth.

(5) Apply black-out primer 15 mm (.75 in.) wide on top and sides of windshield and 25 mm (1 in.) on bottom of windshield. Allow at least three minutes drying time.

(6) Position windshield spacers on lower fence above support spacers at the edge of the windshield opening (Fig. 4).

(7) Apply a 10 mm (0.4 in.) bead of urethane around perimeter of windshield along the inside of the moldings. Apply two beads along the bottom edge.

(8) Install upper molding onto windshield.

(9) Apply fence primer around the perimeter of the windshield opening fence. Allow at least 18 minutes drying time.

(10) With aid of a helper, position windshield over windshield opening. Align reference marks at bottom of windshield to support spacers.

(11) Slowly lower windshield glass to windshield opening fence. Guide top molding into proper position if necessary. Push windshield inward to fence spacers at bottom and until top molding is flush to roof line.

(12) Clean excess urethane from exterior with Mopar Super Clean or equivalent.

(13) Install windshield side moldings.

(14) Install cowl cover and wipers.

(15) Install inside rear view mirror.

(16) After urethane has cured, water test windshield to verify repair.

B-PILLAR DOOR SEAL

REMOVAL

The B-pillar seal is attached to the rear door with adhesive tape.

- (1) Peel seal from the door (Fig. 1).

INSTALLATION

- (1) Clean contact area with Mopar® Super Kleen or equivalent.
- (2) Remove carrier from seal.
- (3) Align seal on door and press into place.

80b46b1e

Fig. 1 B-Pillar Seal

1 - B-PILLAR SEAL

B-PILLAR DOOR SEAL (Continued)

**Fig. 2 Cowl Plenum Seal**

1 - PLENUM SEAL

COWL WEATHERSTRIP

REMOVAL

- (1) Raise hood.
- (2) Pull cowl plenum seal from cowl.
- (3) Separate cowl plenum seal from cowl (Fig. 2).

INSTALLATION

- (1) Position cowl plenum seal on cowl.
- (2) Press cowl plenum seal to seat.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

- (1) Remove inner belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - REMOVAL).
- (2) Remove outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR OUTER BELT WEATHERSTRIP - REMOVAL).
- (3) Grasp seal from upper run channel corner and firmly pull weatherstrip from flange and run channel (Fig. 3).

INSTALLATION

NOTE: Soapy water may be used to aid in installation.

- (1) Remove front door speaker.

**Fig. 3 Front Door Glass Run Channel Weatherstrip**

1 - GLASS RUN CHANNEL WEATHERSTRIP
2 - DOOR

- (2) Position weatherstrip on flange aligning each corner.

- (3) Press weatherstrip into position.
- (4) Carefully move door glass for and aft and press weatherstrip into glass run channels.
- (5) Install front door speaker.
- (6) Install outer belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR OUTER BELT WEATHERSTRIP - INSTALLATION).
- (7) Install inner belt weatherstrip (Refer to 23 - BODY/WEATHERSTRIP/SEALS/FRONT DOOR INNER BELT WEATHERSTRIP - INSTALLATION).

FRONT DOOR INNER BELT WEATHERSTRIP

REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
- (2) Using a trim stick or other suitable device, carefully pry up inner edge of seal (Fig. 4).
- (3) Grasp the edge of the seal and pull upward to remove seal from door flange.

INSTALLATION

- (1) Position the seal on the door flange.
- (2) Firmly press downward to seat seal on the door flange.
- (3) Install the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

FRONT DOOR INNER BELT WEATHERSTRIP (Continued)

**Fig. 4 Inner/Outer Belt Weather Strip**

- 1 - INNER BELT WEATHERSTRIP
2 - OUTER BELT WEATHERSTRIP

**Fig. 5 Flip-up Glass Weatherstrip**

- 1 - WEATHERSTRIP
2 - LIFTGATE W/FLIP-UP GLASS

FRONT DOOR OUTER BELT WEATHERSTRIP

REMOVAL

- (1) Lower the door glass.
- (2) Remove the screw from the inner door panel attaching the seal to outer door panel (Fig. 4).
- (3) Pull the seal rearward to release from the side view mirror bezel.
- (4) Lift seal and separate from door panel.

INSTALLATION

- (1) Position seal on the door panel.
- (2) Push the seal forward to install under the side view mirror bezel.
- (3) Install the screw from the inner door panel attaching the seal to outer door panel.
- (4) Raise the door glass.

FLIP-UP GLASS WEATHERSTRIP

REMOVAL

- (1) Raise flip up glass.
- (2) Carefully pull the seal away from the flange around the edge of the glass opening (Fig. 5).
- (3) Remove it from the vehicle.

INSTALLATION

- (1) Thoroughly clean the surface of the flange as necessary.
- (2) Align the weather strip seal with the window opening corners.

(3) Firmly seat the seal around the entire flange. But the seal ends together and smooth out any remaining length.

(4) Weatherstrip break should be 120mm left of latch opening. Cut any surplus from non-plug end only.

FRONT DOOR SECOND WEATHERSTRIP

REMOVAL

The front door secondary weatherstrip is attached to the door shutface with push-in fasteners.

- (1) Open door.
- (2) Using a trim panel removal tool, remove push-in fasteners attaching secondary weatherstrip to door shutface (Fig. 6).
- (3) Separate secondary weatherstrip from door.

INSTALLATION

- (1) Clean contact area as necessary.
- (2) Position secondary weatherstrip on door shutface.
- (3) Install push-in fasteners attaching secondary weatherstrip to door shutface.

FRONT DOOR WEATHERSTRIP

REMOVAL

- (1) Remove A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).

FRONT DOOR WEATHERSTRIP (Continued)

80b46b2e

Fig. 6 Front Door Secondary Weatherstrip

1 - SECONDARY WEATHERSTRIP

(2) Remove B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).

(3) Remove B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).

(4) Pull weatherstrip from door opening flange.

INSTALLATION

(1) Position weatherstrip at corners.

(2) Move upward and around edge of door opening seating weatherstrip onto flange (Fig. 7).

(3) Engage connector plug with each end of weatherstrip at bottom of door opening.

(4) Install B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).

(5) Install B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

(6) Install A-pillar trim (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).

80b46b4c

1 - HOOD SEAL

HOOD SEAL**REMOVAL**

(1) Raise hood.

(2) Pull hood seal from upper radiator crossmember.

(3) Separate seal from upper radiator crossmember (Fig. 8).

INSTALLATION

(1) Position seal on upper radiator crossmember.

(2) Press seal onto upper radiator crossmember to seat.

LIFTGATE OPENING WEATHERSTRIP

REMOVAL

- (1) Pull seal away from flange around edge of liftgate opening.
- (2) Separate weatherstrip from opening (Fig. 9).
- (3) Clean weatherstrip flange as necessary.

Fig. 9 Liftgate Opening Weatherstrip

- 1 - LIFTGATE
2 - WEATHERSTRIP

INSTALLATION

- (1) Position weatherstrip in opening with left end of seal at opening centerline.
- (2) Press weatherstrip onto flange in a clockwise direction.
- (3) Center and butt weatherstrip ends together at centerline.
- (4) If necessary, cut surplus from weatherstrip (non-plug end only).

REAR DOOR INNER BELT WEATHERSTRIP

REMOVAL

- (1) Remove door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Using a trim stick, carefully pry rear inner edge of inner belt weatherstrip upward.
- (3) Grasp weatherstrip and pull upward to separate from door flange (Fig. 10).

INSTALLATION

- (1) Position weatherstrip on door flange.
- (2) Firmly press downward to seat weatherstrip on flange.

80b46b1c

Fig. 10 Rear Door Inner/Outer Belt Weatherstrip

- 1 - INNER BELT WEATHERSTRIP
2 - OUTER BELT WEATHERSTRIP

- (3) Install trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

REAR DOOR OUTER BELT WEATHERSTRIP

REMOVAL

- (1) Remove trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
- (2) Using a small flat blade, disengage tangs attaching outer belt weatherstrip to inner door panel.
- (3) Lift weatherstrip upward and separate from door (Fig. 10).

INSTALLATION

- (1) Position the weatherstrip onto the door flange.
- (2) Force the weatherstrip onto door flange and engage tangs. Continue rearward until it is seated on flange.
- (3) Install trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).

REAR DOOR SECONDARY WEATHERSTRIP

REMOVAL

The rear door secondary weatherstrip is attached to the door shutface with push-in fasteners.

- (1) Open door.
- (2) Using a trim panel removal tool, remove push-in fasteners attaching secondary weatherstrip to door shutface.

REAR DOOR SECONDARY WEATHERSTRIP (Continued)

(3) Separate secondary weatherstrip from door (Fig. 11).

80b46b1b

Fig. 11 Rear Door Secondary Weatherstrip

1 - SECONDARY WEATHERSTRIP

INSTALLATION

- (1) Clean contact area as necessary.
- (2) Position secondary weatherstrip on door shutface.
- (3) Install push-in fasteners attaching secondary weatherstrip to door shutface.

REAR DOOR WEATHERSTRIP

REMOVAL

- (1) Remove C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
- (2) Remove B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - REMOVAL).
- (3) Remove B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - REMOVAL).
- (4) Remove screws at front of quarter trim panel.
- (5) Pull weatherstrip from door opening flange.

INSTALLATION

- (1) Position weatherstrip at corners.
- (2) Move upward and around edge of door opening seating weatherstrip onto flange (Fig. 7).
- (3) Engage connector plug with each end of weatherstrip at bottom of door opening.
- (4) Install screws at front of quarter trim panel.

(5) Install B-pillar lower trim (Refer to 23 - BODY/INTERIOR/B-PILLAR LOWER TRIM - INSTALLATION).

(6) Install B-pillar upper trim (Refer to 23 - BODY/INTERIOR/B-PILLAR UPPER TRIM - INSTALLATION).

(7) Install C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

ROOF RAIL WEATHERSTRIP / RETAINER

REMOVAL

- (1) Open front and rear doors.
- (2) Remove secondary seal from retainer to access the screws holding the retainer to the A pillar and roof panel.
- (3) Remove the screws holding the retainer in place (Fig. 12).
- (4) Remove the retainer.

80b46b4a

Fig. 12 Upper Body Seal With Retainer

- 1 - ROOF RAIL WEATHERSTRIP
2 - RETAINER
3 - SCREW
4 - BLOCKER

INSTALLATION

- (1) Position the retainer on the A pillar and roof panel.
- (2) Align the screw holes and install the screws.
- (3) Install secondary seal.

HEATING & AIR CONDITIONING

DESCRIPTION - COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating-air conditioning system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Cooling for more information before opening, or attempting any service to the engine cooling system.

DESCRIPTION - HEATER AND AIR CONDITIONER

A manual temperature control type heating-air conditioning system is standard factory-installed equipment on this model. An electronically controlled Automatic Zone Control (AZC) type heating-air conditioning system is an available factory-installed option.

All vehicles are equipped with a common HVAC housing assembly (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel.

DESCRIPTION - REFRIGERANT SYSTEM SERVICE PORT

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

- 2 - EVAPORATOR CORE
- 3 - BLOWER
- 4 - PANEL/DEFROST DOOR
- 5 - HEAT/DEFROST DOOR
- 6 - HEATER CORE
- 7 - RECIRCULATION DOOR

OPERATION - HEATER AND AIR CONDITIONER

Outside fresh air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the HVAC system blower housing. Air flow velocity can then be adjusted with the blower motor speed selector switch on the a/c heater control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the HVAC system to receive a sufficient volume of outside air.

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the HVAC housing is ideal for the growth of certain molds, mildews and other fungi. Any accumu-

HEATING & AIR CONDITIONING (Continued)

lation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during HVAC system operation.

Both the manual and AZC heater and air conditioner are blend-air type systems. In a blend-air system, a blend door controls the amount of unconditioned air (or cooled air from the evaporator) that is allowed to flow through, or around, the heater core. A temperature control knob on the a/c heater control panel determines the discharge air temperature by energizing the blend door actuator, which operates the blend door. This allows an almost immediate control of the output air temperature of the system. The AZC system will have separate blend doors and temperature controls for each front seat occupant.

The mode control knob on the a/c heater control panel is used to direct the conditioned air to the selected system outlets. On manual temperature control systems, the mode control knob switches engine vacuum to control the mode doors, which are operated by vacuum actuators. On AZC systems, the mode control knob switches electrical current to control the mode doors, which are operated by electronic actuators.

The outside air intake can be shut off on manual temperature control systems by selecting the Recirculation Mode with the mode control knob. The outside air intake can be shut off on Automatic Zone Control (AZC) type system by pushing the Recirculation Mode button. This will operate the recirculation door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a variable orifice tube in the liquid line near the condenser outlet tube to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, the a/c low pressure switch on the accumulator cycles the compressor clutch. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C LOW PRESSURE SWITCH - OPERATION)

OPERATION - REFRIGERANT SYSTEM SERVICE PORT

The high pressure service port is located on the discharge line near the condenser. The low pressure service port is located on the suction line near the evaporator at the rear of the engine compartment.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

DIAGNOSIS AND TESTING - A/C PERFORMANCE

The air conditioning system is designed to provide the passenger compartment with low temperature and low specific humidity air. The evaporator, located in the HVAC housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the Recirculation Mode. With the system in the Recirculation Mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

If the vehicle has the optional Automatic Zone Control (AZC) system, and has intermittent operational problems or fault codes, be certain that the wire harness connectors on the HVAC housing are properly seated (Fig. 2). To check this condition, unplug the two wire harness connector halves, then plug them in again.

HEATING & AIR CONDITIONING (Continued)

**Fig. 2 WIRE HARNESS CONNECTORS**

- 1 - INSTRUMENT PANEL
- 2 - HVAC HOUSING
- 3 - INSTRUMENT PANEL WIRE HARNESS
- 4 - BLOWER MOTOR

Before performing the following procedure, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING). The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) If the vehicle has the standard manual temperature control, set the A/C Heater mode control switch knob in the Panel position, the temperature control knob in the full cool (Recirculation Mode) position, the A/C button in the On position, and the blower motor switch knob in the highest speed position. If the vehicle has the optional AZC, set the A/C Heater mode control switch knob in the Panel position, the temperature control knob in the full cool position, the A/C and Recirc buttons in the On position, and the blower motor switch knob in the highest (manual) speed position.

(3) Start the engine and hold the idle at 1,300 rpm with the compressor clutch engaged.

(4) The engine should be at operating temperature. The doors and windows must be open.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, unplug the low pressure switch wire harness connector from the switch located on the accumulator (Fig. 3). Place a jumper wire across the

terminals of the low pressure switch wire harness connector.

**Fig. 3 ACCUMULATOR AND LOW PRESSURE SWITCH**

- 1 - SERVICE PORT
- 2 - LOW PRESSURE SWITCH
- 3 - ACCUMULATOR
- 4 - SUPPORT BRACKET

(7) With the compressor clutch engaged, record the discharge air temperature and the compressor discharge pressure.

(8) Compare the discharge air temperature to the Performance Temperature and Pressure chart. If the discharge air temperature is high, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

HEATING & AIR CONDITIONING (Continued)

Performance Temperature and Pressure					
Ambient Air Temperature and Humidity	21° C (70° F @ 80% humidity)	27° C (80° F @ 80% humidity)	32° C (90° F @ 80% humidity)	38° C (100° F @ 50% humidity)	43° C (110° F @ 20% humidity)
Air Temperature at Center Panel Outlet	0 to 9° C (32 to 48° F)	1 to 12° C (33 to 54° F)	3 to 17° C (37 to 63° F)	6 to 18° C (43 to 65° F)	10 to 18° C (50 to 65° F)
Evaporator Inlet Pressure at Charge Port	151 to 262 kPa (22 to 38 psi)	221 to 248 kPa (32 to 36 psi)	262 to 296 kPa (38 to 43 psi)	303 kPa (44 psi)	310 kPa (45 psi)
Compressor Discharge Pressure	900 to 1380 kPa (130 to 200 psi)	1380 to 2070 kPa (200 to 300 psi)	1720 to 2140 kPa (250 to 310 psi)	1860 to 2140 kPa (270 to 310 psi)	2070 to 2550 kPa (300 to 370 psi)

Note: The discharge air temperatures will be lower if the humidity is less than the percentages shown.

(9) Compare the compressor discharge pressure to the Performance Temperature and Pressure chart. If the compressor discharge pressure is high, see the Pressure Diagnosis chart.

Pressure Diagnosis		
Condition	Possible Causes	Correction
Rapid compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Plumbing/Diagnosis and Testing - Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system. 2. Faulty fuse. 3. Faulty a/c compressor clutch coil. 4. Faulty compressor clutch relay. 5. Improperly installed or faulty a/c low pressure switch. 6. Faulty a/c high pressure switch. 7. Faulty Powertrain Control Module (PCM).	1. See Plumbing/Diagnosis and Testing - Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. 3. See A/C Compressor/Diagnosis and Testing - Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required. 4. See A/C Compressor Clutch Relay/Diagnosis and Testing - Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. 5. See A/C Low Pressure Switch/Diagnosis and Testing in this group. Test the a/c low pressure switch and tighten or replace, if required. 6. See A/C High Pressure Switch/Diagnosis and Testing in this group. Test the a/c high pressure switch and replace, if required. 7. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required.

See A/C Fixed Orifice Tube in this group. Replace the liquid line if restricted. See Liquid Line in this group. 3. See A/C Condenser in this group. Replace the restricted condenser, if required.

DIAGNOSIS AND TESTING - HEATER PERFORMANCE

Before performing the following tests, refer to Cooling for the procedures to check the radiator coolant level, serpentine drive belt tension, radiator air flow and the radiator fan operation. Also be certain that the accessory vacuum supply line is connected at the engine intake manifold for the manual temperature control system.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor heat position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the HVAC housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

Temperature Reference				
Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

If the floor outlet air temperature is too low, refer to Cooling to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Cooling for the procedures.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow:

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A blend door not functioning properly.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob(s) on the A/C Heater control panel, the following could require service:

- The A/C heater control.
- The blend door actuator(s).
- The wire harness circuits for the A/C heater control or the blend door actuator(s).
- The blend door(s).
- Improper engine coolant temperature.

HEATING & AIR CONDITIONING (Continued)

STANDARD PROCEDURE - DIODE REPLACEMENT

(1) Disconnect and isolate the negative battery cable.

(2) Locate the diode in the harness, and remove the protective covering.

(3) Remove the diode from the harness, pay attention to the current flow direction (Fig. 4).

948W-197

Fig. 4 DIODE IDENTIFICATION

1 - CURRENT FLOW

2 - BAND AROUND DIODE INDICATES CURRENT FLOW

3 - DIODE AS SHOWN IN THE DIAGRAMS

(4) Remove the insulation from the wires in the harness. Only remove enough insulation to solder in the new diode.

(5) Install the new diode in the harness, making sure current flow is correct. If necessary refer to the appropriate wiring diagram for current flow.

(6) Solder the connection together using rosin core type solder only. **Do not use acid core solder.**

(7) Tape the diode to the harness using electrical tape making, sure the diode is completely sealed from the elements.

(8) Re-connect the battery, and test affected systems.

CONTROLS

DIAGNOSIS AND TESTING - VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the standard equipment manual temperature control system HVAC housing. Testing of the A/C Heater mode control switch operation will determine if the vacuum and electrical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or a faulty vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem isn't a disconnected vacuum supply tube at the engine intake manifold vacuum tap or the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707-B) and a suitable vacuum pump to test the HVAC vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 1), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

VACUUM CHECK VALVES

(1) Remove the vacuum check valve to be tested. The valves are located in the (black) vacuum supply tubes at either the engine intake manifold vacuum tap, or on the bottom of the HVAC unit behind the passenger front floor duct.

(2) Connect the test set vacuum supply hose to the A/C Heater control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow

J9324-75

Fig. 1 ADJUST VACUUM TEST BLEED VALVE - TYPICAL

- 2 - VACUUM TEST SET C-3707
- 3 - BLEED VALVE
- 4 - PROBE

through the valve without restriction. If not OK, replace the faulty valve.

A/C HEATER CONTROL

(1) Connect the test set vacuum probe to the HVAC vacuum supply (black) tube in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

(2) Place the A/C Heater mode control switch knob in each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See the procedure in Locating Vacuum Leaks.

CAUTION: Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.

CONTROLS (Continued)

LOCATING VACUUM LEAKS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect the vacuum harness connector from the back of the A/C Heater mode control switch on the control panel.

(2) Connect the test set vacuum hose probe to each port in the vacuum harness connector, one at a time, and pause after each connection (Fig. 2). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty mode control switch. If not OK, go to Step 3.

J9324-60

Fig. 2 VACUUM CIRCUIT TEST

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, refer to the Vacuum Circuits chart (Fig. 3).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components.

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (1/8-inch) inside diameter rubber hose.

DESCRIPTION

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 4). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed to the compressor shaft and secured with a bolt.

- 7 - SNAP RING

OPERATION

The compressor clutch components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the a/c switch on the a/c heater control panel, the Automatic Zone Control (AZC) control module (if the vehicle is so equipped), the a/c low pressure switch, the a/c high pressure switch, the a/c compressor clutch relay, and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Electronic Control Modules for more information on the PCM controls.

DIAGNOSIS AND TESTING - COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, refer to the appropriate wiring diagrams. The battery must be fully-charged before performing the following tests. Refer to Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the a/c heater mode control switch in any a/c mode, the a/c heater control a/c switch in the ON position, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within 0.2 volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within 0.2 volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRBIII® scan tool and the appropriate diagnostic information for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- A/C heater mode control switch
- A/C compressor clutch relay
- A/C high pressure switch
- A/C low pressure switch
- Powertrain Control Module (PCM)

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

STANDARD PROCEDURE - COMPRESSOR CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C Heater control in the Recirculation Mode, the A/C button in the on position, the blower motor switch in the highest speed

A/C COMPRESSOR CLUTCH (Continued)

position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the serpentine drive belt. Refer to Cooling for the procedures.

(3) Remove the bolt that secures the compressor clutch to the compressor shaft (Fig. 5). A band-type oil filter wrench may be used to secure the clutch during bolt removal.

Fig. 5 COMPRESSOR SHAFT BOLT

- 1 - COMPRESSOR CLUTCH PLATE
2 - COMPRESSOR SHAFT BOLT

(4) Tap the clutch plate with a plastic mallet to release it from the splines on the compressor shaft. Remove the clutch plate and shim(s) from the compressor shaft (Fig. 6).

CAUTION: Do not pry between the clutch plate assembly and the pulley to remove it from the compressor shaft. Prying may damage the clutch plate assembly.

(5) Remove the external snap ring that secures the compressor clutch pulley to the nose of the compressor front housing with snap ring pliers (Special Tool C-4574) and slide the pulley assembly off of the compressor (Fig. 7).

(6) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing.

Fig. 6 CLUTCH PLATE AND SHIM(S)

- 1 - COMPRESSOR SHAFT
2 - CLUTCH PLATE
3 - CLUTCH PLATE SHIM

Fig. 7 PULLEY SNAP RING

- 1 - SNAP RING

(7) Remove the external snap ring that secures the compressor clutch coil to the nose of the compressor front housing with snap ring pliers and slide the coil assembly off of the compressor (Fig. 8).

INSPECTION

Examine the friction surfaces of the clutch pulley and the clutch plate for wear. The pulley and plate

A/C COMPRESSOR CLUTCH (Continued)

**Fig. 8 CLUTCH COIL SNAP RING**

- 1 - SNAP RING PLIERS
- 2 - CLUTCH COIL
- 3 - SNAP RING
- 4 - COMPRESSOR

should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for refrigerant oil. Remove the felt wick from around the shaft inside the nose of the compressor front housing. If the felt is saturated with refrigerant oil, the compressor shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

INSTALLATION

(1) Align the dowel pin on the back of the clutch field coil with the hole in the compressor front housing and press the field coil into place over the nose of the compressor.

(2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.

(3) Install the clutch field coil and snap ring with snap ring pliers (Special Tool C-4574). The bevel side of the snap ring must be facing outward. Also, both eyelets of the snap ring must be to the right or left of the pin on the compressor. Press in on the snap ring to be certain that it is properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(4) Install the pulley assembly onto the compressor. If necessary, place a block of wood on the friction surface and tap gently with a hammer (Fig. 9).

CAUTION: Do not mar the pulley friction surface.

**Fig. 9 PULLEY ASSEMBLY INSTALL**

- 1 - PULLEY ASSEMBLY
- 2 - WOOD BLOCK

(5) Install the pulley assembly retaining snap ring (bevel side outward) with snap ring pliers (Special Tool C-4574). Press in on the snap ring to be certain that it is properly seated in the groove.

(6) If the original clutch plate assembly and pulley assembly are to be reused, the old shim(s) can be used. If not, place a stack of shim(s) equal to the old shim(s) on the shaft against the shoulder.

(7) Install the clutch plate assembly onto the shaft.

(8) With the clutch plate assembly tight against the shim(s), measure the air gap between the clutch plate and the pulley face with feeler gauges. The air gap should be between 0.35 to 0.65 millimeter (0.014 to 0.026 inch). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.

A/C COMPRESSOR CLUTCH (Continued)

(9) Install the compressor shaft bolt. Tighten the bolt to 13 N·m (115 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is still correct. Spin the pulley before performing a final check of the air gap.

(10) To complete the installation, (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION)

A/C COMPRESSOR CLUTCH RELAY

DESCRIPTION

The compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

OPERATION

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the a/c compressor switch on the a/c heater control panel, the Automatic Zone Control (AZC) control module (if the vehicle is so equipped), the a/c low pressure switch, and the a/c high pressure switch. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH RELAY - DIAGNOSIS AND TESTING)

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C COMPRESSOR CLUTCH RELAY

For circuit descriptions and diagrams, refer to the appropriate wiring information.

The compressor clutch relay (Fig. 10) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and

no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see the Relay Circuit Test procedure in this group. If not OK, replace the faulty relay.

Fig. 10 A/C COMPRESSOR CLUTCH RELAY

30 - COMMON FEED

85 - COIL GROUND

86 - COIL BATTERY

87 - NORMALLY OPEN

87A - NORMALLY CLOSED

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to the appropriate wiring information..

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

A/C COMPRESSOR CLUTCH RELAY (Continued)

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 11).

Fig. 11 POWER DISTRIBUTION CENTER (PDC)

- 1 - TRANSMISSION CONTROL MODULE (TCM)
- 2 - NEGATIVE CABLE
- 3 - POSITIVE CABLE
- 4 - POWER DISTRIBUTION CENTER (PDC)

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

INSTALLATION

(1) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(2) Install the PDC cover.

(3) Connect the battery negative cable.

(4) Test the relay operation.

A/C HEATER CONTROL

DESCRIPTION

The manual temperature control HVAC system uses a combination of electrical, and vacuum con-

trols. The Automatic Zone Control (AZC) HVAC system uses only electrical controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more information on the suggested operation and use of these controls.

Both a/c heater control panels are located on the instrument panel inboard of the steering column and below the radio (Fig. 12). Both control panels contain rotary-type temperature control knob(s), a rotary-type mode control switch knob, a rotary-type blower motor speed switch knob and an air conditioning compressor push button switch. The rear window defogger push button switch is also located on a/c heater control panel. The AZC control panel also features a recirculation push button switch and a vacuum fluorescent display area.

MANUAL AIR CONDITIONING SYSTEM

AUTOMATIC ZONE CONTROL SYSTEM

80b6f021

Fig. 12 A/C HEATER CONTROL PANELS

OPERATION

The AZC control module uses infrared sensing technology to control occupant comfort levels, not the actual passenger compartment air temperature. Dual infrared sensors mounted in the face of the control unit independently measure the surface temperature to maintain customer-perceived comfort temperature under changing conditions. Dual Zone temperature control provides wide side-to-side variation in comfort temperature to exceed the needs of either front seat occupant. This sensing system replaces interior air temperature and solar sensors used to approximate direct sensing control through complex control programs.

A/C HEATER CONTROL (Continued)

Both the manual A/C Heater control panel and the AZC control panel are serviced only as complete units and cannot be repaired. If faulty or damaged, the entire control panel unit must be replaced.

DIAGNOSIS AND TESTING - AUTOMATIC ZONE CONTROL SYSTEM

The Automatic Zone Control (AZC) control module has a system self-diagnostic mode which continuously monitors various parameters during normal system operation. If a system fault is detected, a current and historical fault is recorded. When the current fault is cleared, the historical fault remains until reset (manually or automatically). Both the current and historical fault codes can be accessed through either the front panel, or over the Programmable Communications Interface (PCI) bus using a DRBIII® scan tool, and the appropriate diagnostic information.

The AZC control module is capable of three different types of self-diagnostic tests, as follows:

- Fault Code Tests
- Input Circuit Tests
- Output Circuit/Actuator Tests

The information that follows describes:

- How to read the self-diagnostic display
- How to enter the AZC control module self-diagnostic test mode
- How to select the self-diagnostic test types
- How to perform the different tests

ENTERING THE AZC SELF-DIAGNOSTIC MODE

To enter the AZC self-diagnostic mode, perform the following:

- (1) Depress the a/c and recirc buttons at the same time and hold. Rotate the left temperature control knob clockwise (CW) one detent.

(2) If you continue to keep the a/c and recirc buttons depressed, the AZC control module will perform a Segment Test of the Vacuum Fluorescent (VF) display. In the Segment Test you should see all of the display segments illuminate as long as both buttons are held. If a display segment fails to illuminate, the vacuum fluorescent display is faulty and the a/c heater control must be replaced.

(3) After viewing the Segment Test, release the A/C and Recirc buttons and the display will clear momentarily. **If a 0 is displayed, then no faults are set in the system.** Should there be any faults, either "current" or "historical", all fault codes will be displayed in ascending numerical sequence (note no effort is made to display fault codes in chronological order). Each fault code is displayed for one second before the next code is displayed. Once all fault codes have been displayed, the system will then repeat the fault code numbers. This will continue until the left side set temperature control is moved at least one detent position in the CW direction or the ignition is turned "OFF".

FAULT CODE TESTS

Fault codes are two-digit numbers that identify a circuit that is malfunctioning. There are two different kinds of fault codes.

- **Current Fault Codes** - Current means the fault is present right now. There are two types of current faults: input faults, and system faults.

- **Historical Fault Codes** - Historical or stored means that the fault occurred previously, but is not present right now. A majority of historical fault codes are caused by intermittent wire harness or wire harness connector problems.

	65 = Reserved
	66 = Reserved
	67 = Reserved

NOTE: A battery disconnect will erase all faults stored in Random Access Memory (RAM) of the AZC control module. It is recommended that all faults be recorded before they are erased.

RETRIEVING FAULT CODES

(1) To begin the fault code tests, depress the A/C and Recirc buttons at the same time and rotate the

left temperature control knob clockwise (CW) one detent, then release the push-button.

(2) **If there are no fault codes, the "00" display value will remain in the VF window.** Should there be any codes, each will be displayed for one second in ascending numerical sequence (note: no effort is made to display faults in the order they occurred). The left side set temperature display will

A/C HEATER CONTROL (Continued)

be blanked and the right side set temperature display will indicate current and historical codes (8 historical max) presently active. Once all codes have been displayed, the system will repeat the fault code numbers. This will continue until the left side set temperature control is moved at least one detent position in either direction, by pressing both the A/C and Recirc buttons at the same time, or the ignition is turned off. Record all of the fault codes, then see the Current and Historical Fault Code charts for the descriptions.

CLEARING FAULT CODES

Current faults cannot be electronically cleared. Repair must be made to the system to eliminate the fault causing code. Historical fault codes can be cleared manually, or automatically. To clear a historical fault manually, depress and hold either the A/C or Recirc button for at least three seconds while the display is in the fault code mode of operation. Historical fault codes are cleared automatically when the corresponding current fault code has been cleared, and has remained cleared for a number of ignition cycles. The faults have been cleared when two horizontal bars appear in the Test Selector display.

EXITING SELF-DIAGNOSTIC MODE The self-diagnostic mode can be exited by pressing both the A/C and Recirc buttons at the same time, or turning off the ignition.

MONITOR CURRENT PARAMETERS

While in the display fault code mode of operation, current system parameters can also be monitored and/or forced. Rotating the left side set temperature control clockwise will increase the pointer number while rotating the control counter clockwise will decrease the pointer number. Rotating the right set temperature control will have no impact on pointer value or the value of the parameter being monitored. Once the desired pointer number has been selected, pressing either the AC or Recirc buttons will display the current value of the selected parameter. **The right side set temperature display is only capable of displaying only values ranging from 0 to 99, the left side set temperature display is used for values greater than 99. If the value is less than 99, the left side set temperature display remains blanked.** While a parameter is being overridden, the system will continue to function normally except for the parameter which is being manually controlled.

For values < 0, the "G" segment in the left side set temperature Most Significant Digit (MSD)(or left-most number in the pair) will be used to indicate a negative number. For values between -01 to -99 the Least Significant Digit (LSD)(or right-most number of the pair) in the left side set temperature will

remain blank. System control of parameter being displayed can be overridden by rotating the right set temperature control in either direction. Rotating the right temperature control in the CW direction, the selected parameter value is overridden and incremented beginning at the value which was being displayed. Rotating the right temperature control in the CCW direction, the selected parameter value is overridden and decremented beginning at the value which was being displayed. The rate at which incrementing and decrement occurs is one unit value per set temperature detent position.

OUTPUT CIRCUIT/ACTUATOR TESTS

In the Output Circuit/Actuator Test mode, the output circuits can be viewed, monitored, overridden, and tested. If a failure occurs in an output circuit, test the circuit by overriding the system. Test the actuator through its full range of operation.

(1) To begin the Output Circuit/Actuator Tests you must be in the Select Test mode.

(2) With a "00" value displayed in the Test Selector and no stick man, turn the rotary temperature control knob until the test number you are looking for appears in the Test Selector display. See the Circuit Testing charts for a listing of the test numbers, test items, test types, system tested, and displayed values.

(3) To see the output value, depress the a/c or recirc button. The values displayed will represent the output from the AZC control module.

(4) To enter the actuator test, depress the a/c or recirc button. Then, rotate the right temperature set knob to the desired position.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the center upper, and center lower bezels from the instrument panel. Refer to Instrument Panel System for the procedures.

(3) Remove the 4 screws that secure the a/c heater control to the instrument panel (Fig. 13).

(4) Pull the a/c heater control assembly away from the instrument panel far enough to access the connections on the back of the control.

(5) Unplug the wire and/or vacuum harness connectors from the back of the a/c heater control (Fig. 14).

(6) Remove the a/c heater control from the instrument panel.

A/C HEATER CONTROL (Continued)

**Fig. 13 A/C HEATER CONTROL REMOVE/INSTALL**

1 - MOUNTING SCREW TABS

**Fig. 14 A/C HEATER CONTROL CONNECTIONS**

- 1 - MODE SWITCH
 2 - ELECTRICAL CONNECTIONS
 3 - VACUUM HARNESS

INSTALLATION

- (1) Plug the wire harness and/or vacuum harness connectors into the back of the a/c heater control.
- (2) Position the a/c heater control in the instrument panel and secure it with 4 screws. Tighten the screws to 2.2 N·m (20 in. lbs.).
- (3) Reinstall the center upper, and center lower bezels onto the instrument panel. Refer to Instrument Panel System for the procedures.
- (4) Connect the battery negative cable.

A/C HIGH PRESSURE SWITCH**DESCRIPTION**

The a/c high pressure switch is located in the discharge line near the condenser. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The high pressure switch is connected in series electrically with the low pressure switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels.

The high pressure switch contacts are open when the discharge line pressure rises above 3100 to 3375 kPa (450 to 490 psi). The switch contacts will close when the discharge line pressure drops to 1860 to 2275 kPa (270 to 330 psi).

The high pressure switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C HIGH PRESSURE SWITCH

Before performing diagnosis of the high pressure switch, verify that the refrigerant system has the correct refrigerant charge.

For circuit descriptions and diagrams, refer to the appropriate wiring information.

- (1) Disconnect and isolate the battery negative cable.
- (2) Unplug the wire harness connector from the high pressure switch on the refrigerant system fitting.
- (3) Check for continuity between the two terminals of the high pressure switch. There should be continuity. If OK, test and repair the a/c switch sense circuit as required. If not OK, replace the faulty switch.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Unplug the wire harness connector from the high pressure switch, which is mounted to a fitting on the discharge line near the condenser inlet.
- (3) Unscrew the high pressure switch from the discharge line fitting.
- (4) Remove the high pressure switch from the vehicle.
- (5) Remove the O-ring seal from the discharge line fitting and discard.

INSTALLATION

- (1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

A/C HIGH PRESSURE SWITCH (Continued)

(2) Install and tighten the high pressure switch on the discharge line fitting. The switch should be hand-tightened onto the line fitting.

(3) Plug the wire harness connector into the high pressure switch.

(4) Connect the battery negative cable.

A/C LOW PRESSURE SWITCH

DESCRIPTION

The low pressure switch is located on the top of the accumulator. The switch is screwed onto an accumulator fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The accumulator fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The low pressure switch is connected in series electrically with the high pressure switch, between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This regulates the refrigerant system pressure and controls evaporator temperature. Controlling the evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The low pressure switch contacts are open when the suction pressure is approximately 152 kPa (22 psi) or lower. The switch contacts will close when the suction pressure rises to approximately 234 to 262 kPa (34 to 38 psi) or above. Lower ambient temperatures, below approximately -1° C (30° F), will also cause the switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The low pressure switch is a factory-calibrated unit. It cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - A/C LOW PRESSURE SWITCH

Before performing diagnosis of the low pressure switch, be certain that the switch is properly installed on the accumulator fitting. If the switch is too loose it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure.

Also verify that the refrigerant system has the correct refrigerant charge. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

For circuit descriptions and diagrams, refer to the appropriate wiring information.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the low pressure switch wire harness connector from the switch on the accumulator fitting.

(3) Install a jumper wire between the two cavities of the low pressure switch wire harness connector.

(4) Connect a manifold gauge set to the refrigerant system service ports. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT)

(5) Connect the battery negative cable.

(6) Set the a/c button on, and place the a/c heater mode control switch knob in any a/c position and start the engine.

(7) Check for continuity between the two terminals of the low pressure switch. There should be continuity with a suction pressure reading of 262 kPa (38 psi) or above, and no continuity with a suction pressure reading of 141 kPa (20.5 psi) or below. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the low pressure cycling clutch switch on the top of the accumulator.

(3) Unscrew the a/c low pressure switch from the fitting on the top of the accumulator (Fig. 15).

(4) Remove the O-ring seal from the accumulator fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the accumulator fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Install and tighten the a/c low pressure switch on the accumulator fitting. The switch should be hand-tightened onto the accumulator fitting.

(3) Plug the wire harness connector into the low pressure cycling clutch switch.

(4) Connect the battery negative cable.

BLOWER MOTOR CONTROLLER (Continued)

80b76f91

Fig. 15 ACCUMULATOR AND SUPPORT BRACKET

- 1 - SERVICE PORT
- 2 - LOW PRESSURE SWITCH
- 3 - ACCUMULATOR
- 4 - SUPPORT BRACKET

BLOWER MOTOR CONTROLLER

DESCRIPTION

Models equipped with the optional Automatic Zone Control (AZC) system have a blower motor controller. The controller allows the selection of almost infinitely variable blower motor speeds. The controller is mounted to the HVAC housing, under the instrument panel and just inboard of the blower motor, in the same location used for the blower motor resistor on manual temperature control systems. It can be accessed without removing any other components.

OPERATION

The blower motor controller output to the blower motor can be adjusted by the blower motor speed switch knob on the AZC A/C Heater control panel, or it can be adjusted automatically by the logic circuitry and programming of the AZC control module. In either case, the AZC control module sends the correct pulse width modulated signal to the blower motor controller to obtain the selected or programmed blower motor speed.

The blower motor controller cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Depress locking tab and unplug the wire harness connector from the blower motor controller.
- (3) Depress locking tab and unplug the controller connector from the blower motor.
- (4) Remove the 2 screws that secure the blower motor controller to the HVAC housing.
- (5) Remove the blower motor controller from the HVAC housing (Fig. 16).

80b897c7

Fig. 16 BLOWER MOTOR CONTROLLER REMOVE/INSTALL

- 1 - BLOWER MOTOR CONTROLLER
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

INSTALLATION

- (1) Install the blower motor controller in the HVAC housing. The housing is indexed to allow controller mounting in only one position. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Plug in the wire harness connector to the blower motor controller.
- (3) Plug in the connector from the blower motor controller to the blower motor.
- (4) Connect the battery negative cable.

BLOWER MOTOR RESISTOR BLOCK

DESCRIPTION

Models with the standard manual temperature control system have a blower motor resistor. The blower motor resistor is mounted to the bottom of the HVAC housing, under the instrument panel and just inboard of the blower motor. It can be accessed for service without removing any other components.

OPERATION

The resistor has multiple resistor wires, each of which will reduce the current flow to the blower motor to change the blower motor speed by changing the resistance in the blower motor ground path. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING - BLOWER MOTOR RESISTOR BLOCK

For circuit descriptions and diagrams, refer to the appropriate wiring information.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Depress locking tab and unplug the wire harness connector from the blower motor resistor.

(3) Depress locking tab and unplug the resistor connector from the blower motor.

(4) Remove the 2 screws that secure the blower motor resistor to the HVAC housing.

(5) Remove the blower motor resistor from the HVAC housing (Fig. 17).

80b897c7

Fig. 17 BLOWER MOTOR RESISTOR REMOVE/INSTALL

- 1 - BLOWER MOTOR RESISTOR/CONTROLLER
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

INSTALLATION

(1) Install the blower motor resistor in the HVAC housing. The housing is indexed to allow mounting in only one position. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the blower motor resistor.

(3) Plug in the connector from the blower motor resistor to the blower motor.

BLOWER MOTOR RESISTOR BLOCK (Continued)

- (4) Connect the battery negative cable.

BLOWER MOTOR SWITCH

DESCRIPTION

The A/C Heater blower motor is controlled by a rotary-type blower motor switch, mounted in the A/C Heater control panel. On vehicles with manual temperature control systems, the switch allows the selection of four blower motor speeds, but will only operate with the ignition switch in the On position and the A/C Heater mode control switch in any position, except Off. On vehicles with the Automatic Zone Control (AZC) systems, the switch allows the selection of Lo Auto, Hi Auto, and ten speed settings between Lo and Hi.

OPERATION

On manual temperature control systems, the blower motor switch is connected in series with the blower motor ground path through the a/c heater mode control switch. The blower motor switch directs this ground path to the blower motor through the blower motor resistor wires, or directly to the blower motor, as required to achieve the selected blower motor speed.

On AZC systems, the blower motor switch is just one of many inputs to the AZC control module. In the manual blower modes, the AZC control module adjusts the blower motor speed through the blower motor controller as required to achieve the selected blower switch position. In the auto blower modes, the AZC control assembly is programmed to select and adjust the blower motor speed through the blower motor controller as required to achieve and maintain the selected comfort level.

The blower motor switch cannot be repaired and, if faulty or damaged, it must be replaced. The switch is serviced only as a part of the a/c heater control assembly.

DIAGNOSIS AND TESTING - BLOWER MOTOR SWITCH-MANUAL TEMPERATURE CONTROL SYSTEM

For circuit descriptions and diagrams, refer to the appropriate wiring information.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PER-

FORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

- (1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

- (2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the a/c heater control from the instrument panel. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL) Check for continuity between the ground circuit cavity of the a/c heater control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

- (3) With the a/c heater control wire harness connector unplugged, place the a/c heater mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the a/c heater control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the a/c heater control connector and the blower motor resistor as required. If not OK, replace the faulty a/c heater control unit.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The blower motor switch cannot be adjusted or repaired, and if faulty or damaged, the a/c heater control must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

IN-CAR TEMPERATURE SENSOR

DESCRIPTION

Models equipped with the optional Automatic Zone Control (AZC) system use automatic dual zone temperature control with infrared sensing technology. The temperature sensor is located in the center instrument panel, between the dual temperature knobs of the AZC.

OPERATION

The Automatic Zone Control uses infrared sensing technology to control occupant comfort levels, not the actual passenger compartment air temperature. Dual infrared sensors mounted in the face of the control unit independently measure the surface temperature to maintain customer-perceived comfort temperature under changing conditions. Dual Zone temperature control provides wide side-to-side variation in comfort temperature to exceed the needs of either front seat occupant. This sensing system replaces interior air temperature and solar sensors used to approximate direct sensing control through complex control programs.

The infrared temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the AZC head must be replaced.

NOTE: The infrared sensor window may be permanently damaged if any type of cosmetic vinyl dressings are allowed to contact the lens. Avoid spraying or wiping this area with any cleaner or conditioner. This may result in impaired temperature sensing and control.

REMOVAL

The infrared temperature sensor cannot be adjusted or repaired and, if faulty or damaged, the AZC head must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL)

BLEND DOOR ACTUATOR

DESCRIPTION

The blend door for all models is actuated by an electric actuator, while the AZC system uses 2 separate actuators to allow the driver and passenger to select individual comfort levels. In the following procedures, service for both types of actuators is covered.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

The blend door actuator is used on all models, whether equipped with manual or Automatic Zone Control (AZC). This actuator is located on the front of the HVAC housing to the right of the floor panel transmission tunnel, and can be removed from the passenger compartment without instrument panel or HVAC housing removal.

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the glove box door. Refer to Instrument Panel System for the procedures.
- (3) Remove the lower I/P glove box door surround panel. Refer to Instrument Panel System for the procedures.
- (4) Unplug the wire harness connector from the blend door actuator (Fig. 18).

J9324-17

Fig. 18 BLEND DOOR ACTUATOR

- 1 - BLEND DOOR ACTUATOR
- 2 - ELECTRICAL CONNECTOR

BLEND DOOR ACTUATOR (Continued)

(5) Remove the 2 screws that secure the blend door actuator to the HVAC housing.

(6) Remove the blend door actuator from the HVAC housing.

INSTALLATION

(1) Install the blend door actuator on the HVAC housing and tighten the two mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the blend door actuator.

(3) Install the glove box door. Refer to Instrument Panel System for the procedures.

(4) Install the lower I/P glove box door surround panel. Refer to Instrument Panel System for the procedures.

(5) Connect and the battery negative cable.

MODE DOOR ACTUATOR

DESCRIPTION

The mode door actuators for vehicles equipped with the standard equipment manual temperature control system are vacuum controlled. The optional Automatic Zone Control (AZC) system uses electric motors to actuate all mode doors. The service procedures for both types of actuators are covered by the following procedures.

REMOVAL - HEAT/DEFROST - PANEL/DEFROST DOOR ELECTRIC ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

These actuators are used only on models equipped with the optional Automatic Zone Control (AZC) system.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the two bolts that secure the center instrument panel support bracket to the left side of the floor panel transmission tunnel.

(3) Remove the two bolts that secure the center instrument panel support bracket to the instrument panel.

(4) Remove the center instrument panel support bracket from the vehicle.

(5) Unplug the wire harness connector from the heat/defrost - panel/defrost door actuator (Fig. 19).

80b897c8

Fig. 19 HEAT/DEFROST - PANEL/DEFROST DOOR ACTUATOR

1 - LEVER ASSEMBLY

2 - LINKAGE

3 - ELECTRIC ACTUATOR

(6) Remove the three screws that secure the heat/defrost-panel/defrost door motor to the HVAC housing.

(7) Remove the heat/defrost-panel/defrost door motor from the HVAC housing.

MODE DOOR ACTUATOR (Continued)

REMOVAL - HEAT/DEFROST DOOR VACUUM ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

This actuator is used only on models equipped with the standard manual temperature control system.

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unplug the vacuum harness connector from the heat/defrost door vacuum actuator (Fig. 20).

80b897c5

(3) Disengage the heat/defrost door pivot connection from the heat/defrost door pivot pin.

(4) Remove the screws that secure the heat/defrost door vacuum actuator to the HVAC housing.

(5) Remove the heat/defrost door vacuum actuator from the HVAC housing.

REMOVAL - PANEL/DEFROST DOOR VACUUM ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

This actuator is used only on models equipped with the standard manual temperature control system.

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Unplug the vacuum harness connector from the heat/defrost door vacuum actuator (Fig. 21).

(3) Disengage the panel/defrost door pivot connection from the panel/defrost door pivot pin.

(4) Remove the screws that secure the panel/defrost door vacuum actuator to the HVAC housing.

(5) Remove the panel/defrost door vacuum actuator from the HVAC housing.

INSTALLATION - HEAT/DEFROST - PANEL/DEFROST DOOR ELECTRIC ACTUATOR

(1) Install the heat/defrost-panel/defrost door actuator on the HVAC housing, and tighten the three mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug in the wire harness connector to the heat/defrost - panel/defrost door actuator.

(3) Install the center instrument panel support bracket on the vehicle.

(4) Install the two bolts that secure the center instrument panel support bracket to the instrument panel.

(5) Install the two bolts that secure the center instrument panel support bracket to the left side of the floor panel transmission tunnel.

(6) Connect the battery negative cable.

MODE DOOR ACTUATOR (Continued)

**Fig. 21 PANEL/DEFROST DOOR ACTUATOR**

INSTALLATION - HEAT/DEFROST DOOR VACUUM ACTUATOR

- (1) Install the heat/defrost door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Engage the heat/defrost door pivot connection with the heat/defrost door pivot pin.
- (3) Plug in the vacuum harness connector to the heat/defrost door vacuum actuator.
- (4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTALLATION - PANEL/DEFROST DOOR VACUUM ACTUATOR

- (1) Install the panel/defrost door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Engage the panel/defrost door pivot connection with the panel/defrost door pivot pin.
- (3) Plug in the vacuum harness connector to the heat/defrost door vacuum actuator.
- (4) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

RECIRCULATION DOOR ACTUATOR**DESCRIPTION**

The recirculation door actuator for vehicles equipped with the standard equipment manual temperature control system is vacuum controlled. The optional Automatic Zone Control (AZC) system uses an electric recirculation door actuator. In the following procedures, service for both types of actuators is covered.

REMOVAL - RECIRCULATION DOOR VACUUM ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

This actuator is used only on models equipped with the standard manual temperature control system.

- (1) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.
- (2) Unplug the vacuum harness connector from the recirculation door vacuum actuator.
- (3) Disengage the recirculation door pivot connection from the door pivot pin.
- (4) Disengage the recirculation door actuating rod from the recirculation door lever.
- (5) Remove the screws that secure the recirculation door vacuum actuator to the HVAC housing.
- (6) Remove the recirculation door vacuum actuator from the HVAC housing.

RECIRCULATION DOOR ACTUATOR (Continued)

REMOVAL - RECIRCULATION DOOR ELECTRIC ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

This actuator is used only on models equipped with the optional Automatic Zone Control (AZC) system.

- (1) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.
- (2) Unplug the wire harness connector from the recirculation door actuator.

80b897cd

Fig. 22 RECIRCULATION DOOR HOUSING

- 1 - RECIRCULATION DOOR HOUSING
- 2 - ATTACHING SCREWS

- (3) Remove the 2 screws securing the recirculation door housing to the HVAC unit (Fig. 22). Tilt the front of the housing up while reaching around the back releasing 2 tangs holding the rear of the housing down.

- (4) Remove the recirculation door housing from the HVAC unit.

- (5) Remove the screws that secure the recirculation door actuator to the HVAC housing.

- (6) Remove the recirculation door actuator from the HVAC housing.

INSTALLATION - RECIRCULATION DOOR VACUUM ACTUATOR

- (1) Install the recirculation door vacuum actuator on the HVAC housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

- (2) Engage the recirculation door actuating rod with the recirculation door lever.

- (3) Engage the recirculation door pivot connection with the door pivot pin.

- (4) Plug in the vacuum harness connector to the recirculation door vacuum actuator.

- (5) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

INSTALLATION - RECIRCULATION DOOR ELECTRIC ACTUATOR

- (1) Install the recirculation door actuator on the recirculation door housing and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

- (2) Install the recirculation door housing on the HVAC unit and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

- (3) Plug in the wire harness connector to the recirculation door actuator.

- (4) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

VACUUM CHECK VALVE**DESCRIPTION**

Two vacuum check valves (non AZC only) are installed on the vacuum supply system. One is on the accessory vacuum supply line in the engine compartment, near the vacuum tap on the engine intake manifold. A second vacuum check valve is located on the bottom of the HVAC unit behind the passenger front floor duct on the black vacuum line. The vacuum check valves are designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

OPERATION

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected A/C Heater mode settings. The check valve will prevent the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation.

VACUUM CHECK VALVE (Continued)

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

- (1) Unplug the HVAC vacuum supply line connector at the vacuum check valve near the engine intake manifold vacuum adapter fitting.
- (2) Note the orientation of the check valve in the vacuum supply line for correct installation.
- (3) Unplug the vacuum check valve from the vacuum supply line fittings.

INSTALLATION

- (1) Plug in the vacuum check valve at the vacuum supply line fittings, noting the orientation of the check valve in the vacuum supply line for correct installation.
- (2) Plug in the HVAC vacuum supply line connector at the vacuum check valve near the engine intake manifold vacuum adapter fitting.

VACUUM RESERVOIR

DESCRIPTION

The vacuum reservoir is mounted in the right front of the vehicle behind the headlamp mounting module (Fig. 23). The headlamp mounting module and headlamp assembly must be removed from the vehicle to access the vacuum reservoir for service. Refer to Lamps/Lighting for the procedures.

OPERATION

Engine vacuum is stored in the vacuum reservoir. The stored vacuum is used to operate the vacuum-controlled vehicle accessories during periods of low engine vacuum such as when the vehicle is climbing a steep grade, or under other high engine load operating conditions.

The vacuum reservoir cannot be repaired and, if faulty or damaged, it must be replaced.

Fig. 23 VACUUM RESERVOIR

- 1 - FAN RELAY
- 2 - SPEED CONTROL SERVO
- 3 - VACUUM RESERVOIR

REMOVAL

- (1) Remove the right side headlamp mounting module and headlamp assembly. Refer to Lamps/Lighting for the procedures.
- (2) Remove the two screws that secure the vacuum reservoir to the base of the radiator closure panel.
- (3) Remove the vacuum reservoir.

INSTALLATION

- (1) Install the vacuum reservoir in the vehicle and tighten the two screws to 3.4 N·m (30 in. lbs.).
- (2) Install the right side headlamp mounting module and headlamp assembly. Refer to Lamps/Lighting for the procedures.

AIR OUTLETS

REMOVAL

The driver side, and passenger side panel outlets are available for service. The center outlets are only serviced as part of the instrument cluster center bezel unit.

- (1) Remove the instrument panel top pad from the instrument panel. Refer to Instrument Panel System for the procedures.
- (2) Remove the two screws that secure each outlet to the backside of the instrument panel top pad (Fig. 1).
- (3) Remove the outlet from the top pad.

INSTALLATION

- (1) Fasten the outlet to the top pad. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
- (2) Install the instrument panel top pad on the instrument panel. Refer to Instrument Panel System for the procedures.

BLOWER MOTOR

DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the HVAC housing, below the glove box module. The blower motor controls the velocity of the air flowing through the HVAC housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the a/c heater mode control switch is in any position, except off. The blower motor circuit is protected by a fuse in the junction block. On models with the standard manual temperature control system, the blower motor speed is controlled by regulating the battery feed through the blower motor switch and the blower motor resistor. On models with the optional Automatic Zone Control (AZC) system, the blower motor speed is controlled by using Pulse Width Modulation (PWM). The blower motor controller adjusts the battery feed voltage to the blower motor, based upon an input from the blower motor switch, through the AZC control module. Pulse width modulation of blower power allows the blower to operate at any speed from stationary, to full speed.

The blower motor and blower motor wheel cannot be repaired, and if faulty or damaged, they must be replaced. The blower motor and blower wheel are each serviced separately.

DIAGNOSIS AND TESTING - BLOWER MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG

SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, refer to the appropriate wiring information. Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor circuit wiring or wire harness connections
- Faulty blower motor resistor (if the vehicle is so equipped)
- Faulty blower motor controller (if the vehicle is so equipped)
- Faulty blower motor switch
- Faulty a/c heater mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor (if the vehicle is so equipped)
- Faulty blower motor controller (if the vehicle is so equipped)
- Faulty AZC module (if the vehicle is so equipped)
- Faulty blower motor circuit wiring or wire harness connections.

VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or bent
- Blower motor faulty.

NOISE

To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and operate the HVAC system. If the noise goes away, possible causes include:

- Foreign material in the HVAC housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

BLOWER MOTOR (Continued)

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Pinch the connector retainer and unplug the blower motor wire harness from the blower motor (Fig. 2).

Fig. 2 BLOWER MOTOR (HOUSING REMOVED FROM VEHICLE)

- 1 - BLOWER MOTOR RESISTOR/CONTROLLER
- 2 - BLOWER MOTOR
- 3 - GROUND STRAP
- 4 - ELECTRICAL CONNECTORS
- 5 - HEATER CORE TUBES

(3) Remove the three screws that secure the blower motor and blower wheel assembly to the HVAC housing, using either a T-25 Torx® head or flat-bladed screwdriver.

(4) Lower the blower motor and wheel from the HVAC housing.

(5) Remove the blower wheel retainer clip (Fig. 3).

(6) Remove the wheel from the blower motor shaft.

J9324-92

Fig. 3 BLOWER MOTOR WHEEL REMOVE/INSTALL

- 1 - BLOWER MOTOR WHEEL
- 2 - RETAINER CLIP

INSTALLATION

(1) Press the blower wheel hub onto the blower motor shaft. Be sure the flat on the blower motor shaft is indexed to the flat on the inside of the blower wheel hub.

(2) Install the retainer clip over the blower wheel hub.

(3) Install the blower motor in the HVAC housing with three mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(4) Plug the blower motor wire harness connector into the blower motor socket.

(5) Connect the battery negative cable.

DEFROSTER DUCTS

REMOVAL

(1) Remove the instrument panel assembly from the vehicle. See Instrument Panel System for the procedures.

(2) Remove the three screws that secure the defroster duct to the HVAC unit housing (Fig. 4).

DEFROSTER DUCTS (Continued)

**Fig. 4 HVAC DEFROSTER DUCT**

- 1 - HVAC UNIT HOUSING
- 2 - INSTRUMENT PANEL
- 3 - SCREWS
- 4 - DEFROSTER DUCT

(3) Remove the defroster duct from the HVAC unit housing.

INSTALLATION

(1) Install the defroster duct on the HVAC unit housing.

(2) Install the three screws that secure the defroster duct to the HVAC unit housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Install the instrument panel assembly in the vehicle. See Instrument Panel System for the procedures.

FLOOR DISTRIBUTION DUCTS**REMOVAL**

(1) To remove the driver side floor duct from the vehicle, remove the knee blocker panel for access to attaching screw. See Instrument Panel System for the procedures.

(2) The passenger side floor duct fastener can be accessed under the right-center instrument panel.

(3) Remove the screw that secures the floor duct(s) to the HVAC housing (Fig. 5).

**Fig. 5 FLOOR DUCTS (HOUSING REMOVED)**

- 1 - FLOOR DUCT ADAPTER
- 2 - HEAT/DEFROST DOOR SUB-ASSEMBLY
- 3 - DOOR LEVERS
- 4 - LOWER HOUSING
- 5 - FLOOR DUCTS
- 6 - LINKAGE
- 7 - RETAINING TABS

INSTALLATION

(1) Attach the floor duct(s) to the HVAC housing.

(2) Install the screw that secures the floor duct(s) to the HVAC housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Install the knee blocker panel. See Instrument Panel System for the procedures.

INSTRUMENT PANEL DUCTS**REMOVAL**

(1) Remove the instrument panel top pad from the vehicle. See Instrument Panel System for the procedure.

(2) Unsnap the duct extension(s) from the instrument panel structural duct assembly (Fig. 6).

(3) Remove the duct extension(s) from the instrument panel (Fig. 7).

INSTALLATION

(1) Connect the duct extension(s) to the instrument panel.

(2) Snap the duct extension(s) to the instrument panel structural duct assembly.

INSTRUMENT PANEL DUCTS (Continued)

2 - PANEL DUCT EXTENSION

(3) Install the instrument panel top pad in the vehicle. See Instrument Panel System for the procedure.

REAR FLOOR HEAT DUCT

REMOVAL

(1) To remove the rear floor ducts from the vehicle, remove the knee blocker panels for access, and pull carpeting back.

(2) Pull the floor ducts from the HVAC housing (Fig. 8).

80b8973c

Fig. 8 REAR FLOOR DUCTS

1 - LEFT REAR PASSENGER FLOOR AIR DUCT

2 - RIGHT REAR PASSENGER FLOOR AIR DUCT

3 - TO CARPET DUCT

4 - TO CARPET DUCT

NOTE: The ductwork running from the HVAC housing rearward through the passenger compartment is molded into the carpeting, and must be replaced as a unit if damaged.

REAR FLOOR HEAT DUCT (Continued)

INSTALLATION

- (1) Attach the floor ducts to the HVAC housing.
- (2) Install the knee blocker panels, and install the carpeting back in its original position.

HVAC HOUSING

REMOVAL

The HVAC housing assembly must be removed from the vehicle and the two halves of the housing separated for service access of the heater core, evaporator coil, blend door(s), and each of the various mode doors.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the instrument panel from the vehicle. Refer to Instrument Panel System for the procedures.
- (3) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)
- (4) Disconnect the liquid line refrigerant line from the evaporator inlet tube. Install plugs in, or tape over all of the opened refrigerant line fittings.
- (5) Disconnect the suction line refrigerant line from the evaporator outlet tube. Install plugs in, or tape over all of the opened refrigerant line fittings.
- (6) Disconnect the heater hoses from the heater core tubes. Clamp off the heater hoses to prevent loss of coolant. Refer to Cooling for the procedures. Install plugs in, or tape over the opened heater core tubes.

(7) If the vehicle is equipped with the manual temperature control system, unplug the HVAC system vacuum supply line connector from the tee fitting near the heater core tubes.

(8) Remove the coolant reserve/overflow bottle from the passenger side inner fender shield. Refer to Cooling for the procedures.

(9) Remove the Powertrain Control Module (PCM) from the passenger side dash panel in the engine compartment and set it aside. Do not unplug the PCM wire harness connectors. Refer to Electronic Control Modules for the procedures.

(10) Remove the nuts from the HVAC housing mounting studs on the engine compartment side of the dash panel (Fig. 9).

J9324-12

Fig. 9 HVAC HOUSING REMOVE/INSTALL

- 1 - EVAPORATOR LINES
- 2 - HEATER CORE LINES
- 3 - HVAC UNIT
- 4 - BODY ASSEMBLY

(11) Remove the rear floor heat ducts from the floor heat duct outlets (Fig. 10).

(12) Unplug the HVAC housing wire harness connectors.

(13) Remove the HVAC housing mounting nuts from the studs on the passenger compartment side of the dash panel (Fig. 11).

(14) Remove the HVAC housing from the vehicle, ensuring that the interior is covered in case of loss of fluids.

DISASSEMBLY

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Place the HVAC housing with the tubing side down on a work bench, making allowance for leakage of fluids.

HVAC HOUSING (Continued)

(9) Remove the 10 screws that secure the two housing halves to each other.

(10) Separate the top half of the HVAC housing from the bottom half (Fig. 18).

NOTE: The blend door sub-assembly is attached to the housing with 2 screws, and may be removed for service (Fig. 19).

ASSEMBLY

(1) Place the top half of the HVAC housing on the bottom half. Be certain that each of the door pivot pins align with the pivot holes in the HVAC housing.

(2) Install the 10 screws that secure the two housing halves to each other. Tighten the HVAC housing screws to 2.2 N·m (20 in. lbs.).

(3) Attach the wire harness electrical connector(s) to the mounts on the lower case at the blower motor end of the unit.

(4) Install the 5 clips that secure the two housing halves to each other. Check doors for binding after replacement, and after assembly of housing.

(5) Install the screw with plastic washer holding the lever assembly to the upper case section.

(6) Install the mode door actuator on the left side of the housing.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN PLUMBING BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) Position the HVAC housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install the HVAC housing mounting nuts to the studs on the passenger compartment side of the dash panel. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(3) Connect the HVAC housing wire harness connectors.

(4) Reinstall the rear floor heat ducts to the center floor heat duct outlets.

(5) Install and tighten the nuts onto the HVAC housing mounting studs on the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (60 in. lbs.).

(6) Reinstall the PCM to the passenger side dash panel in the engine compartment. Refer to Electronic Control Modules for the procedures.

(7) Reinstall the coolant reserve/overflow bottle to the passenger side inner fender shield. Refer to Cooling for the procedures.

(8) If the vehicle is equipped with the manual temperature control system, connect the HVAC system vacuum supply line connector to the tee fitting near the heater core tubes.

(9) Unclamp/unplug the heater core hoses and tubes. Connect the heater hoses to the heater core tubes and fill the engine cooling system. Refer to Cooling for the procedures.

(10) Unplug or remove the tape from the suction line and the evaporator outlet tube fittings. Connect the suction line to the evaporator outlet tube. Tighten retaining nut to 28 N·m (250 in. lbs.).

(11) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line to the evaporator inlet tube. Tighten retaining nut to 28 N·m (250 in. lbs.).

(12) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(13) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(14) Install the instrument panel in the vehicle. Refer to Instrument Panel System for the procedures.

(15) Connect the battery negative cable.

(16) Start the engine and check for proper operation of the heating and air conditioning systems.

BLEND DOOR

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Remove evaporator from lower case to ease access to plastic door shaft bushing.

(3) Pinch the retention tabs holding the blend door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer.

(4) Remove door(s).

INSTALLATION

(1) Install the blend door(s) by snapping the pivot shaft into the HVAC case.

(2) Install the evaporator in the lower case.

(3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

NOTE: The blend door sub-assembly is attached to the housing with 2 screws, and may be removed for service (Fig. 20).

80b8990e

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel outlet door pivot shaft retainer from the pivot shaft.

(4) Remove the panel outlet door from the HVAC housing.

REMOVAL - HEAT/DEFROST DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove and disassemble the HVAC housing. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - DISASSEMBLY)

(2) Remove the evaporator, and styrofoam tray from the lower case.

(3) Place the HVAC housing upside down on a work bench.

(4) Unscrew and remove the 2 floor heat ducts.

(5) Unsnap and remove the duct adapter from the bottom of the heat/defrost door sub-assembly (Fig. 22).

Fig. 22 HEAT/DEFROST DOOR DUCTS, AND ADAPTER

REMOVAL - PANEL/DEFROST DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove and disassemble the HVAC housing. See HVAC Housing in this group for the procedures.

(2) Pinch the retention tabs holding the panel/defrost door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer (Fig. 25).

80b9a490

Fig. 25 PANEL/DEFROST DOOR

- 1 - UPPER HOUSING
- 2 - LEVER
- 3 - PANEL/DEFROST MODE DOOR

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel/defrost door pivot shaft retainer from the pivot shaft.

(4) Remove the panel/defrost door from the HVAC housing.

MODE DOOR (Continued)

INSTALLATION - PANEL OUTLET DOOR

(1) Snap the panel outlet door pivot shaft retainer on the pivot shaft.

(2) Attach the panel outlet door pivot shaft to the HVAC case.

(3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTALLATION - HEAT/DEFROST DOOR

(1) Install the heat/defrost door by snapping the heat/defrost door pivot shaft into the HVAC case.

(2) Install the heat/defrost door sub-assembly and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Attach the metal linkage to the heat/defrost door lever.

(4) Snap the duct adapter to the bottom of the heat/defrost door sub-assembly.

(5) Install the 2 floor heat ducts and tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(6) Install the evaporator, and styrofoam tray in the lower case.

(7) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTALLATION - PANEL/DEFROST DOOR

(1) Snap the panel/defrost door pivot shaft retainer on the pivot shaft.

(2) Attach the panel/defrost door pivot shaft to the HVAC case.

(3) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

RECIRCULATION DOOR**REMOVAL**

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Place the HVAC housing right side up on the work bench.

(3) Unplug the wire/vacuum connector from the recirculation door actuator.

(4) Remove the 2 screws fastening the recirculation door sub-assembly to the main housing (Fig. 26).

80b897cd

Fig. 26 RECIRCULATION DOOR HOUSING

- 1 - RECIRCULATION DOOR HOUSING
2 - ATTACHING SCREWS

RECIRCULATION DOOR (Continued)

(5) Raise the front of the door sub-assembly while releasing the 2 tabs holding the rear to the main housing, and remove the recirculation door housing.

(6) Remove the electric/vacuum actuator from the recirculation door sub-assembly and set aside.

(7) Pinch the retention tabs holding the recirculation door pivot shaft to the case. The 3 plastic tabs, located on the inside of the case, are part of the shaft retainer.

(8) Remove the recirculation door from the recirculation air door housing.

(2) Install the electric/vacuum actuator on the recirculation door sub-assembly. Check door for binding after replacement.

(3) Install the recirculation door housing on the HVAC case and tighten the 2 screws to 2.2 N·m (20 in. lbs.).

(4) Plug in the wire/vacuum connector to the recirculation door actuator.

(5) Install the HVAC housing in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

INSTALLATION

(1) Install the recirculation door in the recirculation air door housing by snapping the pivot shaft retention tabs into the case.

PLUMBING

DESCRIPTION - REFRIGERANT LINE

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the

flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

OPERATION - REFRIGERANT LINE

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

PLUMBING (Continued)

The refrigerant lines and hoses are coupled with other components of the HVAC system with peanut-block style fittings. A stat-O seal type flat steel gasket with a captured compressible O-ring, is used to mate plumbing lines with A/C components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

WARNING**WARNING:**

THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.

AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.

DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.

IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION. THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.

THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.

CAUTION**CAUTION:**

Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.

Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.

Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

The refrigerant system must always be evacuated before charging.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.

Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.

Do not remove the sealing caps from a replacement component until it is to be installed.

When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.

Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.

When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

PLUMBING (Continued)

**REFRIGERANT HOSES/LINES/TUBES
PRECAUTIONS**

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.
- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines

and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

**DIAGNOSIS AND TESTING - REFRIGERANT
SYSTEM LEAKS**

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE)

An electronic leak detector designed for R-134a refrigerant is recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system, perform one of the following procedures:

SYSTEM EMPTY

(1) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

PLUMBING (Continued)

(5) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, the A/C button in the On position, and select the Recirculation Mode.

SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, the A/C button in the On position, and select the Recirculation Mode.

STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: EYE PROTECTION MUST BE WORN WHEN SERVICING AN AIR CONDITIONING REFRIGERANT SYSTEM. TURN OFF (ROTATE CLOCKWISE) ALL VALVES ON THE EQUIPMENT BEING USED, BEFORE CONNECTING TO OR DISCONNECTING FROM THE REFRIGERANT SYSTEM. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 1). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow

valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

80add30c

Fig. 1 MANIFOLD GAUGE SET - TYPICAL

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/ BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/ BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/ BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line between the accumulator outlet and the compressor.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

PLUMBING (Continued)

STANDARD PROCEDURE - REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

(1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.

(2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS)

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY)

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

PARTIAL CHARGE METHOD

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

The partial charge method is used to add a partial charge to a refrigerant system that is low on refrigerant. To perform this procedure the evaporator inlet and outlet tube temperatures are measured. The temperature difference is measured with a temperature meter with one or two clamp-on thermocouple probes. The difference between the evaporator inlet and outlet tube temperatures will determine the amount of refrigerant needed.

Before adding a partial refrigerant charge, check for refrigerant system leaks. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS) If a leak is found, make the necessary repairs before attempting a full or partial refrigerant charge.

(1) Attach a manifold gauge set to the refrigerant system service ports.

PLUMBING (Continued)

(2) Attach the two clamp-on thermocouple probes to the inlet and outlet tubes of the evaporator coil.

- If a single thermocouple probe is used, attach the probe to the evaporator inlet tube just before the collar of the refrigerant line connector fitting. The probe must make contact with the bottom surface of the evaporator inlet tube.

- If dual thermocouple probes are used, attach probe 1 to the evaporator inlet tube, and probe 2 to the evaporator outlet tube. Attach both probes to the evaporator tubes just before the collar of the refrigerant line connector fittings. The probes must make contact with the bottom surfaces of the evaporator inlet and outlet tubes.

(3) Open all of the windows or doors of the passenger compartment.

(4) Set the A/C button on the A/C Heater controls to the on position, the temperature control knob in the full cool position, select Recirculation Mode, and place the blower motor switch in the highest speed position.

(5) Start the engine and hold the engine idle speed at 1,000 rpm. Allow the engine to warm up to normal operating temperature.

(6) The compressor clutch may cycle, depending upon ambient temperature, humidity, and the refrigerant system charge level. If the compressor clutch cycles, unplug the wire harness connector from the low pressure cycling clutch switch on the accumulator. Install a jumper wire between the two cavities of the switch wire harness connector.

(7) Hold the engine idle speed at 1,000 rpm.

(8) Allow three to five minutes for the refrigerant system to stabilize, then record the temperatures of the evaporator inlet and outlet tubes.

- If a single probe is used, record the temperature of the evaporator inlet tube. Then remove the probe from the inlet tube and attach it to the evaporator outlet tube just before the collar of the refrigerant line connector fitting. The probe must make contact with the bottom surface of the evaporator outlet tube. Allow the thermocouple and meter time to stabilize, then record the temperature of the evaporator outlet tube. Subtract the inlet tube temperature reading from the outlet tube temperature reading.

- If dual probes are used, record the temperatures of both the evaporator inlet and outlet tubes. Then subtract the inlet tube temperature reading from the outlet tube temperature reading.

(9) If the measured temperature differential is higher than 22° C to 26° C (40° F to 47° F), add 0.4 kilograms (14 ounces) of refrigerant.

(10) Allow three to five minutes for the refrigerant system to stabilize, then take a second set of thermocouple measurements. Record the temperature difference to determine if an additional charge is required.

(11) Record the compressor discharge pressure. If the reading is higher than the pressure shown in the Compressor Discharge Pressure Chart, the system could be overcharged. If the reading is equal to, or lower, than the pressure shown in the chart, continue with this procedure.

Compressor Discharge Pressure Chart

Ambient Temperature	16°C (60°F)	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Compressor Discharge Pressure	1515 kPa (220 psi)	1655 kPa (240 psi)	1790 kPa (260psi)	2070 kPa (300 psi)	2345 kPa (340 psi)	2690 kPa (390 psi)

(12) **EXAMPLE:** The ambient temperature is 21° C (70° F). The evaporator inlet tube temperature is 12° C (54° F) and the evaporator outlet tube temperature is 10° C (50° F). Subtract the inlet tube temperature from the outlet tube temperature. The difference is -2° C (-4° F). With a -2° C (-4° F) temperature differential at 21° C (70° F) ambient temperature, the system is fully charged.

(13) Add enough refrigerant to bring the refrigerant system up to a full charge.

(14) Remove the jumper wire from the low pressure cycling clutch switch wire harness connector and plug the connector back into the switch.

SPECIFICATIONS

CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle is 0.680 kilograms (1.50 pounds/24 ounces).

A/C COMPRESSOR

DESCRIPTION - A/C COMPRESSOR

The air conditioning system uses a Nippondenso 10PA17 ten cylinder, double-acting swash plate-type compressor on all models. This compressor has a fixed displacement of 170 cubic centimeters (10.374

A/C COMPRESSOR (Continued)

cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

DESCRIPTION - HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor manifold, which is on the side of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION - A/C COMPRESSOR

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley, and coil, are available for service.

OPERATION - HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

DIAGNOSIS AND TESTING - COMPRESSOR NOISE

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any

other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Cooling before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C COMPRESSOR CLUTCH - INSTALLATION)

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS)

(5) If the noise is from opening and closing of the high pressure relief valve, reclaim, evacuate, and recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE) If the high pressure relief valve still does not seat properly, replace the a/c compressor.

A/C COMPRESSOR (Continued)

(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL)

(6) If the noise is from liquid slugging on the suction line, replace the accumulator. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/ACCUMULATOR - REMOVAL) Check the refrigerant oil level and the refrigerant system charge. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - SPECIFICATIONS - CHARGE CAPACITY) If the liquid slugging condition continues following accumulator replacement, replace the compressor.

(7) If the noise continues, replace the compressor and repeat Step 1.

REMOVAL

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Recover the refrigerant from the system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt. Refer to Cooling for the procedures.

(4) Unplug the compressor clutch coil wire harness connector.

(5) Remove the (2) refrigerant line retaining bolts that secure the suction line and discharge line to the compressor. Install plugs in, or tape over all of the opened refrigerant fittings.

(6) Remove the bolts that secure the compressor (Fig. 2) or (Fig. 3) and (Fig. 4).

(7) Remove the compressor.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - STANDARD PROCEDURE) Use only refrigerant oil of the type recommended for the compressor in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/REFRIGERANT OIL - DESCRIPTION)

(1) Install the compressor. Tighten the 4.0L mounting bolts fastening the compressor to the block to 45-65 N·m (35-50 ft. lbs.). Tighten the mounting bolts holding the rear brace to the compressor and block to 40-55 N·m (30-40 ft. lbs.). Tighten the 4.7L compressor front mounting screws to 45-65 N·m (35-50 ft. lbs.), and the rear mounting screws to 35-45 N·m (25-35 ft. lbs.).

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction line and discharge line fittings to the manifold on the compressor. Tighten the mounting bolts to 25.4 N·m (225 in. lbs.).

(3) Install the serpentine drive belt. Refer to Cooling for the procedures.

(4) Plug in the compressor clutch coil wire harness connector.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE)

(7) Charge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)

A/C CONDENSER

DESCRIPTION

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins.

OPERATION

When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or

A/C CONDENSER (Continued)

shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

CAUTION: Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT RECOVERY)

(3) Remove the screws attaching the grille and headlamp mounting module to the upper crossmember of the vehicle. Refer to Body for this and further steps in the procedure.

(4) Remove the headlamps from their mounts.

(5) Remove the nuts that secure the hood latch and brace to the upper crossmember.

(6) The radiator upper crossmember can be adjusted left or right through the use of its slotted mounting holes. Before removal, mark the original position of the crossmember.

(7) Remove the bolts that secure the radiator to the upper crossmember and set it aside (Fig. 5).

(8) Remove the engine air filter inlet duct secured at the headlamp mounting module.

(9) Remove the headlamp mounting module and front fascia for access to the condenser and fittings.

(10) Disconnect the discharge line and liquid line refrigerant line fittings from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(11) Remove the bolts that secure the upper condenser and transmission cooler.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should

A/C CONDENSER (Continued)

be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

CAUTION: Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

- (1) Carefully position the condenser in the vehicle.
- (2) Install the bolts that secure the upper condenser and transmission cooler.
- (3) Remove the tape or plugs from the refrigerant line fittings on the condenser inlet and the discharge line. Connect the discharge line to the condenser inlet. Tighten the retaining nut to 28 N·m (250 in. lbs.).
- (4) Remove the tape or plugs from the refrigerant line fittings on the condenser outlet and the liquid line. Connect the liquid line to the condenser outlet. Tighten the retaining nut to 28 N·m (250 in. lbs.).
- (5) Install the headlamp mounting module and front fascia. Refer to Body for the procedure.
- (6) Install the engine air filter inlet duct.
- (7) Install the bolts that secure the radiator to the upper crossmember.
- (8) Install the nuts that secure the hood latch and brace to the upper crossmember.
- (9) Install the headlamps in their mounts.
- (10) Install the screws attaching the grille and headlamp mounting module to the upper crossmember of the vehicle. Refer to Body for this and further steps in the procedure.
- (11) Evacuate and Recharge the refrigerant system. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE)
- (12) Connect the battery negative cable.

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

A/C EVAPORATOR

DESCRIPTION

The evaporator coil is located in the HVAC housing, under the instrument panel. The evaporator coil is positioned in the HVAC housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator coil tubes.

OPERATION

Refrigerant enters the evaporator from the orifice tube as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas before it leaves the evaporator.

A/C EVAPORATOR (Continued)

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL

AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Install the evaporator coil in the bottom half of the HVAC housing. Be certain that the evaporator foam insulator wrap is reinstalled.

(2) Reassemble the HVAC housing and install in the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - ASSEMBLY) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

NOTE: If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.

ACCUMULATOR

DESCRIPTION

The accumulator is mounted in the engine compartment between the evaporator coil outlet tube and the compressor inlet.

OPERATION

Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube. Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system (Fig. 7).

A/C ORIFICE TUBE

DESCRIPTION

The fixed orifice tube is installed in the liquid line between the outlet of the condenser and the inlet of the evaporator. The fixed orifice tube is located in the end of the liquid line that is closest to the condenser outlet tube.

The inlet end of the fixed orifice tube has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the

A/C ORIFICE TUBE (Continued)

metering orifice by refrigerant system contaminants (Fig. 9). The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the fixed orifice tube seal the tube to the inside of the liquid line and prevent the refrigerant from bypassing the fixed metering orifice.

Fig. 9 FIXED ORIFICE TUBE - TYPICAL

- 1 - DIFFUSER SCREEN
- 2 - "O" RINGS
- 3 - INLET FILTER SCREENS
- 4 - ORIFICE

OPERATION

The fixed orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the fixed orifice tube.

The fixed orifice tube cannot be repaired and, if faulty or plugged, the liquid line and fixed orifice tube unit must be replaced.

REMOVAL

The fixed orifice tube is located in the liquid line near the condenser. The orifice has filter screens on the inlet and outlet ends of the tube body. If the fixed orifice tube is faulty or plugged, the liquid line unit must be replaced. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LIQUID LINE - REMOVAL)

HEATER CORE

DESCRIPTION

The heater core is located in the HVAC housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins.

OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and

tubes. Air directed through the heater core picks up the heat from the heater core fins. The temperature control door allows control of the heater output air temperature by controlling how much of the air flowing through the HVAC housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Cooling for more information on the engine cooling system, the engine coolant and the heater hoses.

REMOVAL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN AN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

(1) Remove the HVAC housing from the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL)

(2) Remove the foam gasket surrounding the core tubes.

NOTE: Notice the orientation of the irregularly shaped gasket on the tubes. The gasket must be placed correctly to ensure proper sealing against the body during reinstallation .

(3) Remove the screws and retainers that secure the heater core and tubes to the HVAC housing (Fig. 10).

(4) Remove the mode door actuator if necessary, for clearance to remove the core.

(5) Lift the heater core straight up and out of the HVAC housing (Fig. 11).

HEATER CORE (Continued)

(6) When replacing individual tubes, loosen and remove the round tube-to-core clamp, and pull tube from core.

INSTALLATION

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS SECTION BEFORE PERFORMING THE FOLLOWING OPERATION. (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION)

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is

HEATER CORE (Continued)

pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

(1) When installing individual tubes, insert tube into core ensuring that tube O-ring is seated in core and not pinched. Hold tube in seated position while installing the round tube-to-core clamp (Fig. 12).

Fig. 12 HEATER CORE, TUBES, AND O-RINGS

- 1 - HEATER CORE TUBES
- 2 - TUBE-TO-CORE CLAMPS
- 3 - SCREWS
- 4 - O-RINGS
- 5 - HEATER CORE

NOTE: The round tube-to-heater-core clamp should be left loose enough to turn the tube in the core. Position the core in the housing, and then tighten the tube-to-heater-core clamp after orienting the tubes to the molded HVAC housing.

- (2) Lower the heater core into the HVAC housing.
- (3) Install the mode door actuator, if removed from housing for core removal.
- (4) Position the retainers over the heater core tubes. Install and tighten the screws that secure the heater core and retainers to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

NOTE: The grounding strap is to be attached to the lower heater core tube retainer.

- (5) Reinstall the HVAC housing to the vehicle. (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION)

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The 10PA17 compressor used in this vehicle is designed to use an ND8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

REFRIGERANT OIL (Continued)

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30

milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

Refrigerant Oil Capacities		
Component	ml	fl oz
A/C System	170	5.75
Accumulator	110.6	3.75
Condenser	6.5	0.22
Evaporator	62.7	2.12
Compressor	drain and measure the oil from the old compressor - see text.

EMISSIONS CONTROL

DESCRIPTION - EMISSION CONTROL SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator (check engine) Lamp. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 1).

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16-way data link connector to erase all DTC's and extinguish the MIL (check engine lamp).

80b898f4

Fig. 1 Data Link (Diagnostic) Connector Location

- 1 - INSTRUMENT PANEL LOWER/LEFT EDGE
- 2 - DATA LINK CONNECTOR

DESCRIPTION - STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from

EMISSIONS CONTROL (Continued)

HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

OPERATION - CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

DESCRIPTION - DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

NOTE: For a list of DTC's, refer to the charts in this section.

BULB CHECK

Each time the ignition key is turned to the ON position, the malfunction indicator (check engine) lamp on the instrument panel should illuminate for approximately 2 seconds then go out. This is done for a bulb check.

OBTAINING DTC'S USING DRB SCAN TOOL

(1) Connect the DRB scan tool to the data link (diagnostic) connector. This connector is located in the passenger compartment; at the lower edge of instrument panel; near the steering column.

(2) Turn the ignition switch on and access the "Read Fault" screen.

(3) Record all the DTC's and "freeze frame" information shown on the DRB scan tool.

(4) To erase DTC's, use the "Erase Trouble Code" data screen on the DRB scan tool. **Do not erase any DTC's until problems have been investigated and repairs have been performed.**

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.

Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0462	Fuel Level Sending Unit Volts Too Low	Fuel level sensor input below acceptable voltage.
P0462 (M)	Fuel Level Sending Unit Volts Too Low	Open circuit between PCM and fuel gauge sending unit.
P0463	Fuel Level Sending Unit Volts Too High	Fuel level sensor input above acceptable voltage.
P0463 (M)	Fuel Level Sending Unit Volts Too High	Circuit shorted to voltage between PCM and fuel gauge sending unit.
P0500 (M)	No Vehicle Speed Sensor Signal	No vehicle speed sensor signal detected during road load conditions.
P0500 (M)	No Vehicle Speed Sensor Signal	A vehicle speed signal was not detected.
P0505 (M)	Idle Air Control Motor Circuits	SBEC II
P0522	Oil Pressure Voltage Too Low	Oil pressure sending unit (sensor) voltage input below the minimum acceptable voltage.
P0523	Oil Pressure Voltage Too High	Oil pressure sending unit (sensor) voltage input above the maximum acceptable voltage.
P0524	Oil Pressure Too Low	Engine oil pressure is low. Engine power derated.
P0545	A/C Clutch Relay Circuit	Problem detected in air conditioning clutch relay control circuit.
P0551	Power Steering Switch Failure	Incorrect input state detected for the power steering switch circuit. PL: High pressure seen at high speed.
P0562	Charging System Voltage Too Low	Supply voltage sensed at ECM too low.
P0563	Charging System Voltage Too High	Supply voltage sensed at ECM too high.
P0600	PCM Failure SPI Communications	No communication detected between co-processors in the control module.
P0601 (M)	Internal Controller Failure	Internal control module fault condition (check sum) detected.
P0602 (M)	ECM Fueling Calibration Error	ECM Internal fault condition detected.
P0604	RAM Check Failure	Transmission control module RAM self test fault detected. -Aisin transmission
P0605	ROM Check Failure	Transmission control module ROM self test fault detected -Aisin transmission
P0606 (M)	ECM Failure	ECM Internal fault condition detected.
P0615	Starter Relay Control Circuit	An open or shorted condition detected in the starter relay control circuit.
P0622 (G)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay control circuit.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0700	EATX Controller DTC Present	This SBEC III or JTEC DTC indicates that the EATX or Aisin controller has an active fault and has illuminated the MIL via a CCD (EATX) or SCI (Aisin) message. The specific fault must be acquired from the EATX via CCD or from the Aisin via ISO-9141.
P0703	Brake Switch Stuck Pressed or Released	Incorrect input state detected in the brake switch circuit. (Changed from P1595)
P0711 (M)	Trans Temp Sensor, No Temp Rise After Start	Relationship between the transmission temperature and overdrive operation and/or TCC operation indicates a failure of the Transmission Temperature Sensor. OBD II Rationality. Was MIL code 37.
P0712	Trans Temp Sensor Voltage Too Low	Transmission fluid temperature sensor input below acceptable voltage. Was MIL code 37.
P0712 (M)	Trans Temp Sensor Voltage Too Low	Voltage less than 1.55 volts (4-speed auto. trans. only).
P0713	Trans Temp Sensor Voltage Too High	Transmission fluid temperature sensor input above acceptable voltage. Was MIL code 37.
P0713 (M)	Trans Temp Sensor Voltage Too High	Voltage greater than 3.76 volts (4-speed auto. trans. only).
P0720 (M)	Low Output SPD Sensor RPM, Above 15 MPH	The relationship between the Output Shaft Speed Sensor and vehicle speed is not within acceptable limits.
P0720 (M)	Low Output Spd Sensor RPM Above 15 mph	Output shaft speed is less than 60 rpm with vehicle speed above 15 mph (4-speed auto. trans. only).
P0740 (M)	Torq Con Clu, No RPM Drop at Lockup	Relationship between engine and vehicle speeds indicated failure of torque converter clutch lock-up system (TCC/PTU solenoid)
P0743 (M)	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter clutch (part throttle unlock) solenoid control circuit. Shift solenoid C electrical fault - Aisin transmission
P0743 (M)	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 or 4-speed auto. trans. only).
P0748 (M)	Governor Pressur Sol Control/Trans Relay Circuits	An open or shorted condition detected in the Governor Pressure Solenoid circuit or Trans Relay Circuit in JTEC RE transmissions.
P0748 (M)	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the governor pressure solenoid or relay circuits (4-speed auto. trans. only).
P0751 (M)	O/D Switch Pressed (Lo) More Than 5 Minutes	Overdrive override switch input is in a prolonged depressed state.
P0751 (M)	O/D Switch Pressed (LO) More Than 5 Min	Overdrive Off switch input too low for more than 5 minutes (4-speed auto. trans. only).
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the overdrive solenoid control circuit or Trans Relay Circuit in JTEC RE transmissions. Was MIL code 45.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P0753 (M)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the transmission 2-4 shift solenoid circuit (4-speed auto. trans. only).
P0756	AW4 Shift Sol B (2-3) Functional Failure	Shift solenoid B (2-3) functional fault - Aisin transmission
P0783 (M)	3-4 Shift Sol, No RPM Drop at Lockup	The overdrive solenoid is unable to engage the gear change from 3rd gear to the overdrive gear.
P0801	Reverse Gear Lockout Circuit Open or Short	An open or shorted condition detected in the transmission reverse gear lock-out solenoid control circuit.
P0830	Clutch Depressed Switch Circuit	Problem detected in clutch switch circuit.
P0833	Clutch Released Switch Circuit	Problem detected in clutch switch circuit.
P1110	Decrease Engine Performance Due To High Intake Air Temperature	Intake manifold air temperature is above the engine protection limit. Engine power will be derated.
P1180	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P1195 (M)	1/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/1 during catalyst monitor test. (Also see SCI DTC \$66) (was P0133)
P1196 (M)	2/1 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 2/1 during catalyst monitor test. (Also see SCI DTC \$7A) (was P0153)
P1197	1/2 O2 Sensor Slow During Catalyst Monitor	A slow switching oxygen sensor has been detected in bank 1/2 during catalyst monitor test. (Also see SCI DTC \$68) (was P0139)
P1198	Radiator Temperature Sensor Volts Too High	Radiator coolant temperature sensor input above the maximum acceptable voltage.
P1199	Radiator Temperature Sensor Volts Too Low	Radiator coolant temperature sensor input below the minimum acceptable voltage.
P1281	Engine is Cold Too Long	Engine coolant temperature remains below normal operating temperatures during vehicle travel (Thermostat).
P1282	Fuel Pump Relay Control Circuit	An open or shorted condition detected in the fuel pump relay control circuit.
P1283	Idle Select Signal Invalid	ECM or fuel injection pump module internal fault condition detected.
P1284 (M)	Fuel Injection Pump Battery Voltage Out-Of-Range	Fuel injection pump module internal fault condition detected. Engine power will be derated.
P1285 (M)	Fuel Injection Pump Controller Always On	Fuel injection pump module relay circuit failure detected. Engine power will be derated.
P1286	Accelerator Position Sensor (APPS) Supply Voltage Too High	High voltage detected at APPS.
P1287	Fuel Injection Pump Controller Supply Voltage Low	ECM or fuel injection pump module internal fault condition detected. Engine power will be derated.
P1288	Intake Manifold Short Runner Solenoid Circuit	An open or shorted condition detected in the short runner tuning valve circuit.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1289	Manifold Tune Valve Solenoid Circuit	An open or shorted condition detected in the manifold tuning valve solenoid control circuit.
P1290	CNG Fuel System Pressure Too High	Compressed natural gas system pressure above normal operating range.
P1291	No Temp Rise Seen From Intake Heaters	Energizing Heated Air Intake does not change intake air temperature sensor an acceptable amount.
P1291 (M)	No Temperature Rise Seen From Intake Air Heaters	Problem detected in intake manifold air heating system.
P1292	CNG Pressure Sensor Voltage Too High	Compressed natural gas pressure sensor reading above acceptable voltage.
P1293	CNG Pressure Sensor Voltage Too Low	Compressed natural gas pressure sensor reading below acceptable voltage.
P1294 (M)	Target Idle Not Reached	Target RPM not achieved during drive idle condition. Possible vacuum leak or IAC (AIS) lost steps.
P1295 (M)	No 5 Volts to TP Sensor	Loss of a 5 volt feed to the Throttle Position Sensor has been detected.
P1295 (M)	Accelerator Position Sensor (APPS) Supply Voltage Too Low	APPS supply voltage input below the minimum acceptable voltage.
P1296	No 5 Volts to MAP Sensor	Loss of a 5 volt feed to the MAP Sensor has been detected.
P1297 (M)	No Change in MAP From Start To Run	No difference is recognized between the MAP reading at engine idle and the stored barometric pressure reading.
P1298	Lean Operation at Wide Open Throttle	A prolonged lean condition is detected during Wide Open Throttle
P1299	Vacuum Leak Found (IAC Fully Seated)	MAP Sensor signal does not correlate to Throttle Position Sensor signal. Possible vacuum leak.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the ASD or CNG shutoff relay control ckt.
P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the auto shutdown relay circuit.
P1389	No ASD Relay Output Voltage At PCM	No Z1 or Z2 voltage sensed when the auto shutdown relay is energized.
P1389 (M)	No ASD Relay Output Voltage at PCM	An open condition detected In the ASD relay output circuit.
P1390	Timing Belt Skipped 1 Tooth or More	Relationship between Cam and Crank signals not correct
P1391 (M)	Intermittent Loss of CMP or CKP	Loss of the Cam Position Sensor or Crank Position sensor has occurred. For PL 2.0L
P1398 (M)	Mis-Fire Adaptive Numerator at Limit	PCM is unable to learn the Crank Sensor's signal in preparation for Misfire Diagnostics. Probable defective Crank Sensor
P1399	Wait To Start Lamp Cicuit	An open or shorted condition detected in the Wait to Start Lamp circuit.
P1403	No 5V to EGR Sens	Loss of 5v feed to the EGR position sensor.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P01475	Aux 5 Volt Supply Voltage High	Sensor supply voltage for ECM sensors is too high.
P1476	Too Little Secondary Air	Insufficient flow of secondary air injection detected during aspirator test (was P0411)
P1477	Too Much Secondary Air	Excessive flow of secondary air injection detected during aspirator test (was P0411).
P1478	Battery Temp Sensor Volts Out of Limit	Internal temperature sensor input voltage out of an acceptable range.
P1479	Transmission Fan Relay Circuit	An open or shorted condition detected in the transmission fan relay circuit.
P1480	PCV Solenoid Circuit	An open or shorted condition detected in the PCV solenoid circuit.
P1481	EATX RPM Pulse Perf	EATX RPM pulse generator signal for misfire detection does not correlate with expected value.
P1482	Catalyst Temperature Sensor Circuit Shorted Low	Catalyst temperature sensor circuit shorted low.
P1483	Catalyst Temperature Sensor Circuit Shorted High.	Catalyst temperature sensor circuit shorted high.
P1484	Catalytic Converter Overheat Detected	A catalyst overheat condition has been detected by the catalyst temperature sensor.
P1485	Air Injection Solenoid Circuit	An open or shorted condition detected in the air assist solenoid circuit.
P1486	Evap Leak Monitor Pinched Hose Found	LDP has detected a pinched hose in the evaporative hose system.
P1487	Hi Speed Rad Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the #2 high speed radiator fan control relay.
P1488	Auxiliary 5 Volt Supply Output Too Low	Auxiliary 5 volt sensor feed is sensed to be below an acceptable limit.
P1488	5 Volt Supply Voltage Low	Sensor supply voltage for ECM sensors is too low.
P1489	High Speed Fan CTRL Relay Circuit	An open or shorted condition detected in the control circuit of the high speed radiator fan control relay.
P1490	Low Speed Fan CTRL Relay Circuit	An open or shorted condition detected in control circuit of the low speed radiator fan control relay.
P1491	Rad Fan Control Relay Circuit	An open or shorted condition detected in the radiator fan control relay control circuit. This includes PWM solid state relays.
P1492	Ambient/Batt Temp Sen Volts Too High	External temperature sensor input above acceptable voltage.
P1492 (M)	Ambient/Batt Temp Sensor Volts Too High	Battery temperature sensor input voltage above an acceptable range.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	External temperature sensor input below acceptable voltage.
P1493 (M)	Ambient/Batt Temp Sen Volts Too Low	Battery temperature sensor input voltage below an acceptable range.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1494 (M)	Leak Detection Pump Sw or Mechanical Fault	Incorrect input state detected for the Leak Detection Pump (LDP) pressure switch.
P1495	Leak Detection Pump Solenoid Circuit	An open or shorted condition detected in the Leak Detection Pump (LDP) solenoid circuit.
P1496	5 Volt Supply, Output Too Low	5 volt sensor feed is sensed to be below an acceptable limit. (less than 4v for 4 sec)
P1498	High Speed Rad Fan Ground CTRL Rly Circuit	An open or shorted condition detected in the control circuit of the #3 high speed radiator fan control relay.
P1499	Hydraulic cooling fan solenoid circuit	An open or shorted condition detected in the cooling fan control solenoid circuit.
P1594 (G)	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1594	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in either of the speed control vacuum or vent solenoid control circuits.
P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in the speed control vacuum or vent solenoid circuits.
P1596	Speed Control Switch Always High	Speed control switch input above maximum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below minimum acceptable voltage.
P1597	Speed Control Switch Always Low	Speed control switch input below the minimum acceptable voltage.
P1598	A/C Pressure Sensor Volts Too High	A/C pressure sensor input above maximum acceptable voltage.
P1598	A/C Sensor Input Hi	Problem detected in air conditioning electrical circuit.
P1599	A/C Pressure Sensor Volts Too Low	A/C pressure sensor input below minimum acceptable voltage.
P1599	A/C Sensor Input Lo	Problem detected in air conditioning electrical circuit.
P1680	Clutch Released Switch Circuit	Problem detected in clutch switch electrical circuit.
P1681	No I/P Cluster CCD/J1850 Messages Received	No CCD/J1850 messages received from the cluster control module.
P1682 (G)	Charging System Voltage Too Low	Battery voltage sense input below target charging voltage during engine operation and no significant change in voltage detected during active test of generator output circuit.
P1682	Charging System Voltage Too Low	Charging system output voltage low.
P1683	SPD CTRL PWR Relay; or S/C 12v Driver CKT	An open or shorted condition detected in the speed control servo power control circuit.
P1683	Spd ctrl pwr rly, or s/c 12v driver circuit	An open or shorted condition detected in the speed control servo power control circuit.

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1684	Batt Loss in 50 Star	The battery has been disconnected within the last 50 starts
P1685	SKIM Invalid Key	The engine controller has received an invalid key from the SKIM.
P1686	No SKIM BUS Messages Received	No CCD/J1850 messages received from the Smart Key Immobilizer Module (SKIM).
P1687	No MIC BUS Message	No CCD/J1850 messages received from the Mechanical Instrument Cluster (MIC) module.
P1688 (M)	Internal Fuel Injection Pump Controller Failure	Internal problem within the fuel injection pump. Low power, engine derated, or engine stops.
P1689 (M)	No Communication Between ECM and Injection Pump Module	Data link circuit failure between ECM and fuel injection pump. Low power, engine derated, or engine stops.
P1690 (M)	Fuel Injection Pump CKP Sensor Does Not Agree With ECM CKP Sensor	Problem in fuel sync signal. Possible injection pump timing problem. Low power, engine derated, or engine stops.
P1691	Fuel Injection Pump Controller Calibration Error	Internal fuel injection pump failure. Low power, engine derated, or engine stops.
P1692	DTC Set In ECM	A "Companion DTC" was set in both the ECM and PCM.
P1693 (M)	DTC Detected in Companion Module	A fault has been generated in the companion engine control module.
P1693 (M)	DTC Detected in PCM/ECM or DTC Detected in ECM	A "Companion DTC" was set in both the ECM and PCM.
P1694	Fault In Companion Module	No CCD/J1850 messages received from the powertrain control module-Aisin transmission
P1694 (M)	No CCD Messages received from ECM	Bus communication failure to PCM.
P1695	No CCD/J1850 Message From Body Control Module	No CCD/J1850 messages received from the body control module.
P1696	PCM Failure EEPROM Write Denied	Unsuccessful attempt to write to an EEPROM location by the control module.
P1697	PCM Failure SRI Mile Not Stored	Unsuccessful attempt to update Service Reminder Indicator (SRI or EMR) mileage in the control module EEPROM.
P1698	No CCD/J1850 Message From TCM	No CCD/J1850 messages received from the electronic transmission control module (EATX) or the Aisin transmission controller.
P1698	No CCD Messages received from PCM	Bus communication failure to PCM. A "Companion DTC" was set in both the ECM and PCM.
P1719	Skip Shift Solenoid Circuit	An open or shorted condition detected in the transmission 2-3 gear lock-out solenoid control circuit.
P1740	TCC or OD Sol Perf	A rationality error has been detected in either the TCC solenoid or overdrive solenoid systems.

EMISSIONS CONTROL (Continued)

(M) Malfunction Indicator Lamp (MIL) illuminated during engine operation if this DTC was recorded (depending if required by CARB and/or EPA). MIL is displayed as an engine icon on instrument panel.		
(G) Generator lamp illuminated		
Generic Scan Tool P-Code	DRB Scan Tool Display	Brief Description of DTC
P1740 (M)	TCC OR O/D Solenoid Performance	Problem detected in transmission convertor clutch and/or overdrive circuits (diesel engine with 4-speed auto. trans. only).
P1756 (M)	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear. (Mid Pressure Malfunction)
P1756 (M)	Governor Pressure Not Equal to Target @ 15-20 PSI	Governor sensor input not between 10 and 25 psi when requested (4-speed auto. trans. only).
P1757	GOV Press Not Equal to Target @ 15-20 PSI	The requested pressure and the actual pressure are not within a tolerance band for the Governor Control System which is used to regulate governor pressure to control shifts for 1st, 2nd, and 3rd gear (Zero Pressure Malfunction)
P1757 (M)	Governor Pressure Above 3 PSI In Gear With 0 MPH	Governor pressure greater than 3 psi when requested to be 0 psi (4-speed auto. trans. only).
P1762 (M)	Gov Press Sen Offset Volts Too Low or High	The Governor Pressure Sensor input is greater than a calibration limit or is less than a calibration limit for 3 consecutive park/neutral calibrations.
P1762 (M)	Governor Press Sen Offset Volts Too Low or High	Sensor input greater or less than calibration for 3 consecutive Neutral/Park occurrences (4-speed auto. trans. only).
P1763	Governor Pressure Sensor Volts Too Hi	The Governor Pressure Sensor input is above an acceptable voltage level.
P1763 (M)	Governor Pressure Sensor Volts Too HI	Voltage greater than 4.89 volts (4-speed auto. trans. only).
P1764 (M)	Governor Pressure Sensor Volts Too Low	The Governor Pressure Sensor input is below an acceptable voltage level.
P1764 (M)	Governor Pressure Sensor Volts Too Low	Voltage less than .10 volts (4-speed auto. trans. only).
P1765 (M)	Trans 12 Volt Supply Relay CTRL Circuit	An open or shorted condition is detected in the Transmission Relay control circuit. This relay supplies power to the TCC
P1765 (M)	Trans 12 Volt Supply Relay Ctrl Circuit	Current state of solenoid output port is different than expected (4-speed auto. trans. only).
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch.
P1899 (M)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch (3 or 4-speed auto. trans. only).

EMISSIONS CONTROL (Continued)

DESCRIPTION - TASK MANAGER

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is called the 'Task Manager'.

OPERATION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator Lamp (MIL) will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the MIL or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

The following is an operation and description of each system monitor :

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault **MUST** be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evapora-

EMISSIONS CONTROL (Continued)

tive system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" water. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the O2 control system. If fuel vapor, indicated by a shift in the O2 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can

EMISSIONS CONTROL (Continued)

cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O₂S's) to monitor the efficiency of the converter. The dual O₂S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O₂S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O₂S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O₂S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O₂S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O₂S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O₂S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O₂S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O₂S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL will be illuminated.

DESCRIPTION - TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it

depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Continuous OBDII Monitor fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor, is considered to be a Good Trip. These will include the following:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

OPERATION - COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (MIL) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks or any component that has an associated limp in will set a fault after 1 trip with the malfunction present. Components without

EMISSIONS CONTROL (Continued)

an associated limp in will take two trips to illuminate the MIL.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

DESCRIPTION - NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIRFLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

OPERATION - HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

OPERATION - TASK MANAGER

The Task Manager determines which tests happen when and which functions occur when. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illu-

EMISSIONS CONTROL (Continued)

minates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- Pending

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- Conflict

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the EGR Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- Suspend

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the EGR monitor, the Task Manager may still run the EGR Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the EGR system is actually failing or if an Oxygen Sensor is failing.

MIL Illumination

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a third trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third key cycle) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

Diagnostic Trouble Codes (DTCs)

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

Priorities

- Priority 0 — Non-emissions related trouble codes
- Priority 1 — One trip failure of a two trip fault for non-fuel system and non-misfire.
- Priority 2 — One trip failure of a two trip fault for fuel system (rich/lean) or misfire.
- Priority 3 — Two trip failure for a non-fuel system and non-misfire or matured one trip comprehensive component fault.
- Priority 4 — Two trip failure or matured fault for fuel system (rich/lean) and misfire or one trip catalyst damaging misfire.

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

DTC Self Erasure

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are auto-

EMISSIONS CONTROL (Continued)

matically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within ± 375 RPM and load is within $\pm 10\%$ of when the fault occurred.

NOTE: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.

DTCs can be erased anytime with a DRB III. Erasing the DTC with the DRB III erases all OBD II information. The DRB III automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

Trip Indicator

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

Good Trip

The Good Trip counters are as follows:

- Specific Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on DRB III)
- Comprehensive Components
- Major Monitor
- Warm-Up Cycles

Specific Good Trip

The term Good Trip has different meanings depending on the circumstances:

- If the MIL is OFF, a trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.
- If the MIL is ON and a DTC was set by the Fuel Monitor or Misfire Monitor (both continuous monitors), the vehicle must be operated in the Similar Condition Window for a specified amount of time.
- If the MIL is ON and a DTC was set by a Task Manager commanded once-per-trip monitor (such as the Oxygen Sensor Monitor, Catalyst Monitor, Purge Flow Monitor, Leak Detection Pump Monitor, EGR Monitor or Oxygen Sensor Heater Monitor), a good trip is when the monitor is passed on the next start-up.

- If the MIL is ON and any other emissions DTC was set (not an OBD II monitor), a good trip occurs when the Oxygen Sensor Monitor and Catalyst Monitor have been completed, or two minutes of engine run time if the Oxygen Sensor Monitor and Catalyst Monitor have been stopped from running.

Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the DRB III. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

CAUTION: Erasing DTCs, either with the DRB III or by disconnecting the battery, also clears all Freeze Frame data.

EMISSIONS CONTROL (Continued)

Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **Upstream O₂S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.

- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.

- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than cali-

brated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.

- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).

- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.

- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.

- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.

- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.

- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.

- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.

- **200 Rev Counter** — Counts 0–100 720 degree cycles.

- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.

- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.

- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.

- **Misfire Data** — Data collected during test.

- **Test Done This Trip** — Indicates YES when the test is done.

EVAPORATIVE EMISSIONS

DESCRIPTION - EVAPORATION CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes to a charcoal filled evaporative canister. The canister temporarily holds the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system for OBD II requirements. Also refer to Leak Detection Pump.

NOTE: The evaporative system uses specially manufactured lines/hoses. If replacement becomes necessary, only use fuel resistant hose.

EVAPORATIVE EMISSIONS (Continued)

DESCRIPTION - CCV SYSTEM

The 4.0L 6-cylinder engine is equipped with a Crankcase Ventilation (CCV) system. The system consists of:

- A fixed orifice fitting of a calibrated size. This fitting is pressed into a rubber grommet located on the top/rear of cylinder head (valve) cover (Fig. 1).
- a pair of breather tubes (lines) to connect the system components.
- the air cleaner housing.
- an air inlet fitting (Fig. 1).

80b898f9

- 1 - AIR INLET FITTING
- 2 - FIXED ORIFICE FITTING
- 3 - CCV BREATHER TUBE (REAR)
- 4 - INT. MAN. FITTING
- 5 - CCV BREATHER TUBE (FRONT)

DESCRIPTION - PCV SYSTEM

The 4.7L V-8 engine is equipped with a closed crankcase ventilation system and a Positive Crankcase Ventilation (PCV) valve.

This system consists of:

- a PCV valve mounted to the oil filler housing (Fig. 2). The PCV valve is sealed to the oil filler housing with an o-ring.
- the air cleaner housing

- two interconnected breathers threaded into the rear of each cylinder head (Fig. 3).
- tubes and hose to connect the system components.

80b89905

- 1 - O-RING
- 2 - LOCATING TABS
- 3 - CAM LOCK
- 4 - OIL FILLER TUBE
- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

OPERATION - 4.0L CCV SYSTEM

The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled PCV valve.

The fixed orifice fitting meters the amount of crankcase vapors drawn out of the engine.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Engine vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

EVAPORATIVE EMISSIONS (Continued)

80b89906

Fig. 3 PCV System Hoses/Tubes—4.7L Engine

- 1 - FRESH AIR FITTING
- 2 - CONNECTING TUBES/HOSES
- 3 - CRANKCASE BREATHERS (2)
- 4 - RUBBER HOSE
- 5 - AIR CLEANER RESONATOR

OPERATION - 4.7L PCV SYSTEM

The PCV system operates by engine intake manifold vacuum. Filtered air is routed into the crankcase through the air cleaner hose and crankcase breathers. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow-by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

TYPICAL PCV valves are shown in (Fig. 4), (Fig. 5) and (Fig. 6).

When the engine is not operating, or during an engine pop-back, the spring forces the plunger back against the seat (Fig. 4). This will prevent vapors from flowing through the valve.

**Fig. 4 Engine Off or Engine Pop-Back—No Vapor Flow**

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 5). In this position there is minimal vapor flow through the valve.

J8925-14

Fig. 5 High Intake Manifold Vacuum—Minimal Vapor Flow

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 6).

J8925-15

DIAGNOSIS AND TESTING - CCV SYSTEM - 4.0L

Before attempting diagnosis, be sure locations of fixed orifice fitting and air inlet fitting (Fig. 7) have not been inadvertently exchanged. The fixed orifice fitting is light grey in color and is located at **rear** of valve cover. The air inlet fitting is black in color and is located at **front** of valve cover.

Fig. 7 Fixed Orifice Fitting and CCV System—4.0L Engine

- 1 - AIR INLET FITTING
- 2 - FIXED ORIFICE FITTING
- 3 - CCV BREATHER TUBE (REAR)
- 4 - INT. MAN. FITTING
- 5 - CCV BREATHER TUBE (FRONT)

(1) Pull fixed orifice fitting (Fig. 7) from valve cover and leave tube attached.

(2) Start engine and bring to idle speed.

(3) If fitting is not plugged, a hissing noise will be heard as air passes through fitting orifice. Also, a strong vacuum should be felt with a finger placed at fitting inlet.

(4) If vacuum is not present, remove fitting orifice fitting from tube. Start engine. If vacuum can now be felt, replace fixed orifice fitting. Do not attempt to clean plastic fitting.

(5) If vacuum is still not felt at hose, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at intake manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

(6) Return fixed orifice fitting to valve cover and leave tube attached.

(7) Disconnect air inlet fitting and its attached hose at front of valve cover (Fig. 7). Start engine and bring to idle speed. Hold a piece of stiff paper (such as a parts tag) loosely over the rubber grommet (opening) of the disconnected air inlet fitting.

(8) The paper should be drawn against the rubber grommet with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(9) If vacuum is not present, check breather hoses/tubes/lines for obstructions or restrictions.

(10) After testing, reconnect all system hoses/tubes/lines.

REMOVAL - FIXED ORIFICE FITTING

When installing fixed orifice fitting, be sure locations of fixed orifice fitting and air inlet fitting (Fig. 8) have not been inadvertently exchanged. The fixed orifice fitting is light grey in color and is located at **rear** of valve cover. The air inlet fitting is black in color and is located at **front** of valve cover.

(1) Pull fixed orifice fitting (Fig. 8) from valve cover grommet.

(2) Separate fitting from CCV breather tube.

CCV HOSE (Continued)

- 5 - CCV BREATHER TUBE (FRONT)

INSTALLATION - FIXED ORIFICE FITTING

When installing fixed orifice fitting, be sure locations of fixed orifice fitting and air inlet fitting (Fig. 8) have not been inadvertently exchanged. The fixed orifice fitting is light grey in color and is located at **rear** of valve cover. The air inlet fitting is black in color and is located at **front** of valve cover.

- (1) Connect fitting to CCV breather tube.
- (2) Return fixed orifice fitting to valve cover grommet.

EVAP/PURGE SOLENOID**DESCRIPTION**

The duty cycle EVAP canister purge solenoid (DCP) regulates the rate of vapor flow from the EVAP canister to the intake manifold. The Powertrain Control Module (PCM) operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM cycles (energizes and de-energizes) the solenoid 5 or 10

times per second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time that the solenoid is energized. The PCM adjusts solenoid pulse width based on engine operating condition.

REMOVAL

The duty cycle evaporative (EVAP) canister purge solenoid is located in the engine compartment in front of the EVAP canister (Fig. 15).

80ba7720

Fig. 9 EVAP Canister Purge Solenoid Removal/Installation

- 1 - EVAP CANISTER
- 2 - EVAP CANISTER PURGE SOLENOID
- 3 - ELECTRIC CONNECTOR
- 4 - MOUNTING BRACKET NUTS (2)
- 5 - SOLENOID BRACKET

- (1) Disconnect electrical connector at solenoid.
- (2) Disconnect vacuum lines at solenoid.
- (3) Remove two bracket mounting nuts (Fig. 9) and remove solenoid/solenoid bracket.

INSTALLATION

- (1) Position solenoid/solenoid bracket to vehicle.
- (2) Install and tighten 2 bracket mounting nuts to 9 N·m (80 in. lbs.) torque.
- (3) Connect vacuum lines to solenoid. Be sure vacuum lines are firmly connected and not leaking or

EVAP/PURGE SOLENOID (Continued)

damaged. If leaking, a Diagnostic Trouble Code (DTC) may be set with certain emission packages.

- (4) Connect electrical connector to solenoid.

FUEL FILLER CAP

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a California emissions package and a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

LEAK DETECTION PUMP

DESCRIPTION

The Leak Detection Pump (LDP) is used only with certain emission packages.

The LDP is a device used to detect a leak in the evaporative system.

The pump contains a 3 port solenoid, a pump that contains a switch, a spring loaded canister vent valve seal, 2 check valves and a spring/diaphragm.

Immediately after a cold start, engine temperature between 40°F and 86°F, the 3 port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non-test conditions, the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling. This is due to the operation of the 3 port solenoid which prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized, allowing atmospheric pressure to enter the pump cavity. This permits the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de-energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

PUMP MODE: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test time.

TEST MODE: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5 inches of water.

When the pump starts, the cycle rate is quite high. As the system becomes pressurized pump rate drops. If there is no leak the pump will quit. If there is a leak, the test is terminated at the end of the test mode.

If there is no leak, the purge monitor is run. If the cycle rate increases due to the flow through the purge system, the test is passed and the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

A typical system schematic is shown in (Fig. 10).

LEAK DETECTION PUMP (Continued)

LEAK DETECTION PUMP (Continued)

REMOVAL

The LDP is located in the left/front corner of engine compartment below air cleaner housing (Fig. 11). It is mounted to left/front inner fender sheet metal. The LDP and LDP filter are replaced (serviced) as one unit.

80ba7721

Fig. 11 Leak Detection Pump (LDP) Removal/Installation

- 1 - LEAK DETECTION PUMP (LDP)
- 2 - MOUNTING BOLTS (3)
- 3 - LDP FILTER
- 4 - LEFT/FRONT INNER FENDER
- 5 - ELEC. CONN.

(1) Remove air cleaner housing. Refer to Air Cleaner Housing/Resonator/Ducts Removal/Installation.

- (2) Disconnect electrical connector at LDP.
- (3) Carefully remove vapor/vacuum lines at LDP.
- (4) Remove 3 LDP mounting bolts (Fig. 11).
- (5) Remove LDP from inner fender.

INSTALLATION

The LDP is located in the left/front corner of engine compartment below air cleaner housing (Fig. 11). It is mounted to left/front inner fender sheet metal. The LDP and LDP filter are replaced (serviced) as one unit.

(1) Install LDP assembly to inner fender. Install 3 bolts and tighten to 2 N·m (20 in. lbs.) torque.

(2) Carefully install vapor/vacuum lines to LDP and LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**

(3) Connect electrical connector to LDP.

(4) Install air cleaner housing. Refer to Air Cleaner Housing/Resonator/Ducts Removal/Installation.

PCV VALVE

DIAGNOSIS AND TESTING - PCV VALVE/PCV SYSTEM - 4.7L

(1) Disconnect PCV line/hose (Fig. 12) by disconnecting rubber connecting hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward until locating tabs have been freed at cam lock (Fig. 12). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 12). Also, PCV valve should rattle when shaken.

(4) Reconnect PCV valve to its connecting line/hose.

(5) Start engine and bring to idle speed.

(6) If valve is not plugged, a hissing noise will be heard as air passes through valve. Also, a strong vacuum should be felt with a finger placed at valve inlet.

(7) If vacuum is not felt at valve inlet, check line/hose for kinks or for obstruction. If necessary, clean out intake manifold fitting at rear of manifold. Do this by turning a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

(8) **Do not attempt to clean the old PCV valve.**

(9) Return PCV valve back to oil filler tube by placing valve locating tabs (Fig. 12) into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(10) Connect PCV line/hose and connecting rubber hose to PCV valve.

(11) Disconnect rubber hose from fresh air fitting at left side of air cleaner resonator box (Fig. 13). Start engine and bring to idle speed. Hold a piece of

PCV VALVE (Continued)

stiff paper (such as a parts tag) loosely over the opening of the disconnected rubber hose.

(12) The paper should be drawn against the hose opening with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(13) If vacuum is not present, disconnect each PCV system hose at top of each breather (Fig. 13). Check for obstructions or restrictions.

(14) If vacuum is still not present, remove each PCV system breather (Fig. 13) from each cylinder head. Check for obstructions or restrictions. If plugged, replace breather. Tighten breather to 12 N·m (106 in. lbs.) torque. Do not attempt to clean breather

(15) If vacuum is still not present, disconnect each PCV system hose at each fitting and check for obstructions or restrictions.

80b89906

Fig. 13 PCV Breathers/Tubes/Hoses—4.7L V-8 Engine

- 1 - FRESH AIR FITTING
- 2 - CONNECTING TUBES/HOSES

- 2 - LOCATING TABS
- 3 - CAM LOCK
- 4 - OIL FILLER TUBE
- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

REMOVAL - PCV VALVE - 4.7L

The PCV valve is located on the oil filler tube (Fig. 14). Two locating tabs are located on the side of the valve (Fig. 14). These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

(1) Disconnect PCV line/hose (Fig. 14) by disconnecting rubber hose at PCV valve fitting.

(2) Remove PCV valve at oil filler tube by rotating PCV valve downward (counter-clockwise) until locating tabs have been freed at cam lock (Fig. 14). After tabs have cleared, pull valve straight out from filler tube. **To prevent damage to PCV valve locating tabs, valve must be pointed downward for removal. Do not force valve from oil filler tube.**

(3) After valve is removed, check condition of valve o-ring (Fig. 14).

PCV VALVE (Continued)

**Fig. 14 PCV Valve/Oil Filler Tube Location**

- 1 - O-RING
- 2 - LOCATING TABS
- 3 - CAM LOCK
- 4 - OIL FILLER TUBE
- 5 - PCV LINE/HOSE
- 6 - PCV VALVE

INSTALLATION - PCV VALVE - 4.7L

The PCV valve is located on the oil filler tube (Fig. 14). Two locating tabs are located on the side of the valve (Fig. 14). These 2 tabs fit into a cam lock in the oil filler tube. An o-ring seals the valve to the filler tube.

(1) Return PCV valve back to oil filler tube by placing valve locating tabs (Fig. 14) into cam lock. Press PCV valve in and rotate valve upward. A slight click will be felt when tabs have engaged cam lock. Valve should be pointed towards rear of vehicle.

(2) Connect PCV line/hose and rubber hose to PCV valve.

VACUUM LINES**DIAGNOSIS AND TESTING - VACUUM LINES**

A vacuum line schematic for emission related items can be found on the Vehicle Emission Control Information (VECI) label. For label location, refer to Vehicle Emission Control Information (VECI) Label.

VAPOR CANISTER**DESCRIPTION**

A maintenance free, EVAP canister is used on all vehicles. The EVAP canister is filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canister are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canister. Fuel vapors are temporarily held in the canister until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canister to be purged at predetermined times and at certain engine operating conditions.

REMOVAL

The EVAP canister is located in the engine compartment near the brake power booster (Fig. 15).

**Fig. 15 EVAP Canister, EVAP Solenoid, LDP Test Port Locations**

- 1 - EVAP CANISTER
- 2 - LDP TEST PORT

VAPOR CANISTER (Continued)

80b89909

Fig. 16 EVAP Canister Removal/Installation

- 1 - REAR BRACKET
- 2 - FRONT BRACKET
- 3 - EVAP CANISTER
- 4 - CANISTER MOUNTING BOLTS
- 5 - ALIGNMENT PINS

(1) Remove duty cycle EVAP canister purge solenoid and its mounting bracket at front of EVAP canister (2 nuts).

- (2) Disconnect vacuum lines at EVAP canister.
- (3) Remove 2 canister mounting bolts at front mounting bracket (Fig. 16).
- (4) Remove canister from rear mounting bracket (2 pins are used (Fig. 16) to align canister to rear bracket)

INSTALLATION

- (1) Position canister to body. Guide pins into rear bracket.
- (2) Install canister mounting bolts. Tighten bolts to 11 N·m (100 in. lbs.) torque.
- (3) Connect vacuum lines. Be sure vacuum lines are firmly connected and not leaking or damaged. If leaking, a Diagnostic Trouble Code (DTC) may be set with certain emission packages.
- (4) Install duty cycle EVAP canister purge solenoid and its mounting bracket to front of EVAP canister (2 nuts). Tighten nuts to 9 N·m (80 in. lbs.) torque.

INTRODUCTION

DESCRIPTION - THE IMPORTANCE OF CAREFUL NEW VEHICLE PREPARATION

Today, the automobile industry is more competitive than it has been for decades. Automakers around the world, including DaimlerChrysler, have made tremendous improvements in the quality of their vehicles.

As a result, customer expectations have also risen. Today's customers are more particular about their vehicles than ever before. The result is that problems once regarded as insignificant (such as a squeak or rattle) can now make the difference between a repeat customer and one who never purchases another vehicle from you dealership or another DaimlerChrysler Corporation product.

As a technician preparing a new car or truck for delivery, you are the final step in the entire quality process. Your inspection is the final opportunity to detect any flaws that would disappoint the customer. Your efforts will reflect upon the thousands of men and women who design, engineer and build DaimlerChrysler products as well as upon your dealership and on yourself as a competent, conscientious technician.

As manufacturing quality has improved, prep procedures have come to serve as additional quality checks. However, there are several compelling reasons for careful new vehicle preparation.

- **Safety**-You assure the customer that his or her new vehicle meets all federal safety standards.

- **Emissions Controls**-When your customers are assured that their new cars meet emissions standards, they will know that they are contributing to cleaner air and helping control pollution.

- **Customer Satisfaction**-First impressions are very important on a new vehicle. Careful new vehicle preparation will impress your customer.

- **Competition**-It is common knowledge in the industry that the availability of efficient service is one of the decisive factors in determining which cars will sell. A vehicle delivered to your customers in first class condition, inside and out, will bring them back to the dealership for the kind of service you have led them to expect and for their next new car.

This information outlines service procedures which will ensure that DaimlerChrysler Corporation vehicles are ready for delivery to the customer when they are complete. These procedures follow a logical order, from a careful underhood inspection, to the moment when you complete the warranty certificate and turn the keys over to your customer.

When you have completed the procedures described in this information, both you and your customer will be assured that his or her new vehicle will perform as expected.

USING THE MANUAL

This guide to new vehicle preparation covers all items on the New Vehicle Preparation Form (Fig. 1).

NEW VEHICLE PREPARATION

Form No. 84-320-4740 (Rev. 1-1-78)
GPO 11-700

Fig. 1 NEW VEHICLE PREPARATION FORM

INTRODUCTION (Continued)

Items found requiring adjustment and/or repair should be corrected before delivery of the vehicle.

NOTE: It is the dealer's responsibility to protect new vehicles from damage and deterioration prior to retail delivery both before and after new vehicle preparation.

The information includes the following features:

Inspection points are cross-referenced to the New Vehicle Preparation Form as follows:

- Titles indicate the general area being inspected or the types of checks being made (i.e., underhood, body-exterior, road test, etc.).
- Sub-Titles identify the types of items to be inspected in that area (i.e., lines/hoses, wiring, etc.).

Procedures follow a logical order to prevent duplication and wasted effort.

Tips to help you do a better job are found as **NOTES**.

RECEIVING

INSPECTION

The following procedures are recommended for your own protection upon receipt of new vehicles. When a new car is delivered by the carrier, it should be inspected to ensure that it is in good condition and to determine if there is any shortage or transportation damage.

EXTERIOR

Upon receipt of a new vehicle, check immediately for:

- Under carriage damage
- Chipped or cracked windshield, broken windows, and loose or missing moldings and name-plates
- Dents, scrapes, scratches, chips, dirt in paints or other damage to the body exterior
- Damaged or missing side view mirror(s)
- Missing wheel nuts
- Broken or missing lenses
- Chafing, bruises, cuts, or scrapes on tire side-walls or tread
- Missing underhood items
- Missing fuel filler cap
- Shipped loose items-license plate bracket, spare tire, jack and tire wrench, radio antenna, floor mats, wheel covers, cargo nets, fuses and other items
- Ensure that IOD fuse is removed
- Check battery test indicator when easily visible, or use voltmeter (battery must be at 12.4 volts or greater). Charge to ensure green dot-visibility, permanent damage may occur if battery remains in a discharged state for any length of time.

INTERIOR

Check interior items such as:

- Rearview mirror
- Accessory control knobs
- Smokers package items
- Keys
- Radio
- Special equipment items listed on shipper
- Owner's Manual and Consumer information Brochures (normally stored in the glove box).
- Cuts, abrasions or stains on interior trim.

NOTE: Remember a careful look at new vehicles when they are received may prevent problems when preparing vehicles for delivery to your customers.

MAJOR INSPECTION POINTS

(1) Check operation of hood latch and safety catch-adjust as required.

(2) Check all fluids for proper level and top off with the proper fluid as required-engine oil, automatic transmission fluid, brake master cylinder, clutch master cylinder, power steering, windshield washer, and cooling system. (Vehicle must be at normal operating temperature for some of these checks.)

(3) Check brake, clutch, fuel, and power steering lines and hoses for leaks and clearance from moving and hot objects-reroute to the proper location and tighten as required.

(4) Check battery state of charge-recharge if necessary, to ensure green dot is visible or instrument panel voltmeter indicates 12.4 volts or greater.

(5) Check routing and connections of underhood wiring, vacuum hoses, refrigerant lines and coolant hoses for leaks, loose connections and clearance from moving objects reroute and tighten connections as required. Install IOD fuse on applicable vehicles.

NOTE: Reset radio, clock, compass, etc., after installing, if vehicle is being delivered.

UNDER HOOD

INSPECTION - HOOD LATCH/SAFETY CATCH

Check operation of hood latch and safety catch (Fig. 2) adjust as required.

NOTE: The safety catch prevents the hood from going to full open position until it is manually released. To test the safety catch, unlock the hood with the interior release, then try to raise the hood without operating the safety catch.

UNDER HOOD (Continued)

**Fig. 2 HOOD LATCH AND SAFETY CATCH**

- 1 - STRIKER
- 2 - SAFETY CATCH
- 3 - HOOD LATCH

INSPECTION - FLUID LEVELS**ENGINE OIL**

CAUTION: Use only oil that meets the specified requirements.

NOTE: If oil level is low, inspect for oil leaks.

Check engine oil level. The oil should be in the safe range or between the minimum and maximum marks.

- If the oil level is at the minimum mark, add oil that meets specifications.
- The best time to check the oil is about 5 minutes after a fully warmed-up engine is turned off, or before starting the engine after it has been off overnight.
- For the most accurate readings, the vehicle should be on level ground.
- Wipe up any excess oil that may have spilled, or the customer could mistakenly perceive this as the result of a leak.

AUTOMATIC TRANSMISSION/TRANSAXLE

CAUTION: Only use fluid that meets the vehicle's specific requirement. Consult the service manual for information.

NOTE: Mopar ATF Plus contains special additives not found in Mercon and Dexron II fLuids. Use of fluid other than Mopar Plus (when specified) could result in an upshift shudder in some applications.

Transmission and transaxle fluid check procedures are specific to each vehicle line.

BRAKE MASTER CYLINDER**Fig. 3 Brake Master Cylinder Reservoir**

CAUTION: Only use fluid that meets specified requirements (DOT 3).

NOTE: Wipe the master cylinder cover to remove any dirt.

NOTE: On vehicles equipped with remote antilock brakes, the fluid level check is the same as for a normal system.

Check the brake master cylinder fluid level (Fig. 3). Add fluid to bring the level to the full line on the side of the reservoir (or above the bottom of the split ring in the primary filler hole). Be sure both primary and secondary cavities are full to the maximum level as indicated.

UNDER HOOD (Continued)

POWER STEERING RESERVOIR

80927693

Fig. 4 Power Steering Reservoir - 4.7L

CAUTION: Only use fluid that meets specified requirements. Petroleum fluids, such as Mopar® Power Steering Fluid, are specially formulated for use with power steering hoses and seals.

CAUTION: On 4.7L engine vehicles, **DO NOT** operate engine if power steering fluid in the power steering reservoir (Fig. 4) is below the add level indicator mark. Severe damage to the engine, radiator cooling fan or power steering pump can occur.

NOTE: On 4.7L engine vehicles, the power steering pump supplies hydraulic fluid under pressure to the hydraulic radiator cooling fan. If fluid level is low in the power steering reservoir, insufficient fluid volume and/or pressure may be supplied to the fan motor preventing the radiator cooling fan from operating properly and allowing the engine to over heat.

Check the fluid level; it should be maintained at the proper level indicated on the dipstick, or as viewed through the translucent reservoir. If fluid is required, fill to the proper level. With the engine running at normal operating temperature, turn the steering wheel from stop to stop to expel air from within the system. Stop the engine, remove the cap, and recheck the fluid level, making sure that foaming is not present.

WINDSHIELD WASHER RESERVOIR

80927697

Fig. 5 Windshield Washer Reservoir

CAUTION: Do not add engine coolant (antifreeze) to this reservoir.

CAUTION: Avoid spilling washer solvent on the vehicles paint; it could harm the finish.

Check windshield washer solvent reservoir (Fig. 5) and fill as necessary.

NOTE: When using concentrated solvent such as Mopar® All-Weather Windshield Washer Solution, dilute per container directions.

COOLING SYSTEM RESERVOIR

WARNING: Do not remove radiator cap while cooling system is under pressure.

NOTE: Add coolant only to plastic reserve tank if it is required. Engine must be at normal operating temperature before adding coolant to reserve tank. In cold climates, coolant in reserve tank may appear low; do not add coolant until normal temperature is reached.

Check coolant level with engine idling at normal operating temperature. Coolant level in plastic reserve tank (Fig. 6) must be between the minimum and maximum marks.

UNDER HOOD (Continued)

8092768b

Fig. 6 Engine Coolant Reservoir

If coolant is added, use a 50/50 —34.4°C (-30°F protection) concentration of the recommended anti-freeze and distilled water (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION). Use a higher concentration (up to 65%) if a lower freeze point is required. Do not use recycled coolant in new vehicles.

INSPECTION - LINES/HOSES

Inspect the following for line and hose leaks. Also inspect routing and connections and reroute and tighten as required.

- Brake Lines (Fig. 7)
- Fuel Lines (Fig. 7)
- Parking Brake Cables (Fig. 8)
- ABS Wiring, if equipped (Fig. 8)
- Power Steering Hoses
- Vacuum Hoses
- Heating/Coolant Hoses
- Refrigerant Lines

INSPECTION - BATTERY

When battery is easily accessible, check the test indicator (green dot), terminal tightness and felt (grease) washer on battery posts. Recharge battery as required to assure that the green dot is visible.

When battery is not easily accessible check battery condition with a voltmeter at the jump start locations, or check the voltmeter on the instrument panel (Fig. 9). The reading should be at least 12.4 volts. Recharge battery as required (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE).

809276a7

Fig. 7 Brake Lines and Fuel Lines

- 1 - FUEL LINES
- 2 - BRAKE LINE
- 3 - REAR BRAKE SPLITTER BLOCK

809276a3

Fig. 8 Parking Brake Cables and ABS Wiring

- 1 - PARKING BRAKE CABLES
- 2 - ABS WIRING (IF EQUIPPED)

UNDER HOOD (Continued)

Fig. 9 Instrument Cluster Battery Voltage Gauge

INSPECTION - WIRING

The assembly plant has shipped all vehicles with the interior lights and most electronic memories non-functional by way of an Ignition Off Draw (IOD) fuse removed. The purpose is to reduce the possibility of battery run-down during shipping and storage.

Vehicles stored after prep should have the IOD fuse that activates the accessories pulled to prevent battery drain.

NOTE: Ensure that the IOD fuse is removed to prevent battery drain and possible damage. Vehicles stored for extended periods after prep should be washed frequently, to prevent environmental damage, and reinspected for storage-related problems before delivery.

- (1) Install the IOD fuse as equipped. (ON vehicles being delivered, remember to reset radio, clock, compass, etc., as required.)
- (2) Check routing and connections of all underhood wiring-reroute and connect as required.
- (3) Make sure the starter, generator and air conditioning clutch wiring are correctly installed, routed, and in the clips where provided.
- (4) For predelivery storage, always pull the IOD fuse that activates accessories.

UNDER VEHICLE

INSPECTION - TIRE PRESSURES

- (1) Using the tire placard or the Safety Certification Label, check that the correct tires are mounted on the vehicle.
- (2) Install valve stem extensions as required.
- (3) Using the tire placard or the Safety Certification Label, check tire pressure (including spare) and adjust as required to recommended pressure.

NOTE: Tire pressure may have been set above normal during manufacturing in order to properly seat the tire bead. Be sure to adjust to proper specification.

INSPECTION - VISUAL

CAUTION: Before raising the vehicle on a hoist, (Refer to LUBRICATION & MAINTENANCE/LIFT POINTS - STANDARD PROCEDURE).

- (1) Visually inspect the following for loose attachment, leakage, clearance and routing, and tighten connections and clamps as required:

- Engine
- Oil Cooler
- Cooling System
- Transmission
- Driveshaft Boots
- Differential
- Transfer Case (Fig. 10)
- Transmission Cooler
- Brake System
- Fuel System
- Exhaust System
- Steering and Suspension Components

Fig. 10 Transfer Case

INSTALLATION - WHEEL COVERS

- (1) Align valve notch in wheel cover with valve stem on shell. Install cover on wheel by hand only.
- (2) Install and torque wheel nuts to 135 N·m (100 lb. ft.).
- (3) Install nut caps, if equipped using lug wrench, do not over tighten.
- (4) Remove release liner from removal instructions label and install label next to jacking instructions label. Surface must be clean and flat for proper adhesion of label.

EXTERIOR

INSPECTION - BODY SEALING

Visually inspect the following seals during the normal recommended wash. Look for areas where water may have entered the vehicle.

- Door and window seals
- Windshield
- Backlight
- Decklid / liftgate / tailgate
- Sunroof or convertible top

INSPECTION - FIT AND FINISH

(1) Remove all protective coatings/covers. Remove protective film from body moldings.

(2) Make sure body is free from paint chips, scratches, sags, run, dirt or corrosion. Touch up any minor paint chips and scratches as required.

(3) Ensure that moldings and stripes are present and securely fastened to the body.

NOTE: Painted-on accent strips require a unique paint for touch-ups.

(4) Check that the door panels have even gaps and fit well with adjacent body panels.

(5) Check that the liftgate (Fig. 11) has even gaps and fits well with adjacent panels.

Fig. 11 Liftgate Alignment

(6) Check that the hood panel (Fig. 12) has even gaps and fits well with adjacent panels.

Fig. 12 Hood Alignment

(7) Check that the sunroof glass has even gaps and fits well with adjacent panels.

(8) Ensure that the body is free from dents and dings.

INSPECTION - KEYLESS ENTRY

Check operation of keyless entry system and program the transmitter/receiver if necessary.

INSPECTION - DOORS AND DOOR LOCKS

(1) Check operation of doors and locks, keyless entry, security alarm and liftgate. Adjust strikers and latches as required.

(2) Check operation of childproof door locks, if so equipped.

(3) Remove any protective covers from the door sills.

NOTE: Windows should be in the full up position during these tests (except for the lock tests).

- Open each door (inside and out) to check the release mechanism and ease of operation.
- Partially close the door to check the open-door detent.
- Close the door to check the latches and striker (Fig. 13) and (Fig. 14).
- Open the door, lower the windows depress the lock switch and close the door to check the lock (Fig. 15).
- Unlock each door (using both keys) to check lock and key operation.

NOTE: Child proof door locks should be disabled when delivered to the customer.

BODY INTERIOR (Continued)

8092751d

Fig. 13 Door Latch

8092757b

Fig. 15 Window, Mirror and Lock Switches

(2) Remove protective film from overhead console, if equipped.

8092754b

Fig. 14 Door Striker

809273c3

Fig. 16 Overhead Console with Electronic Compass

BODY INTERIOR

INSPECTION - COMPASS

NOTE: Set variance after calibration.

(1) Calibrate and set compass variance (Fig. 16), if so equipped (use appropriate procedures in service information).

INSPECTION - FIT AND FINISH

- (1) Remove any interior covers.
- (2) Inspect the instrument panel, glove box door and interior moldings for even gaps and alignments.
- (3) Check that the door panel material is clean, free from wrinkles and installed correctly.
- (4) Check that the seat material is clean, secure and free of wrinkles.
- (5) Check that the carpet is clean, secure and free of wrinkles.
- (6) Check that the headliner is clean, free of lint and dirt smudges.

INSPECTION - LIGHTS AND SWITCHES

- (1) Remove protective film from all switch bezels.

BODY INTERIOR (Continued)

(2) Operate and visually inspect all interior lights and switches, including:

- Dome/map lamps
- Vanity mirror lamps
- Glove box light
- Ashtray light
- Cigar lighter light
- All gauge lights
- Radio display
- Door-mounted lights, if equipped
- Illuminated entry system, if equipped

(3) Visually inspect and operate all exterior lights and their switches, including:

NOTE: Headlamp aim is preset during vehicle assembly.

- Headlights, including high beam, optical horn ("flash to pass") and daylight running lamps (DRL's)
 - Tail/stop lamps (including center high-mounted stop lamp)
 - Parking lights Turn signals Brake lights (including center high mounted stop lamp)
 - Emergency flashers
 - Fog/driving lights, if equipped
 - Off-road or other lights, if equipped
 - Cargo bed lights, if equipped
- (4) Check ignition switch for proper operation in all positions (accessory, lock, on, start and off).

INSPECTION - SEAT BELTS, SHOULDER BELTS, RETRACTORS AND HEAD RESTRAINTS

- (1) Inspect all seat belts and harnesses to ensure that they connect and hold properly.
- (2) Inspect the condition of the belts and anchors.
- (3) Inspect for proper seat belt retraction.
- (4) Check that safety labels (Fig. 17) regarding the use of seat belts and air bags are in place (such as on the sun visors).

Fig. 17 SAFETY LABELS

- (5) Ensure head restraints (Fig. 18) are properly installed. Inspect the height adjustment for ease of operation.

Fig. 18 Head Restraints

INSPECTION - SEATS

- (1) Remove protective seat, carpet and door covers (if being delivered) where applicable.
- (2) Check that manual/power seat adjustments work properly for all seats.
 - Inspect the operation of front seat mechanical slides and power adjusters
 - Check the seatback recliner for ease of release and operation
 - Check the rear seatback latches for ease of release
 - On fold-down rear seats, latch the rear seats and pull forward on the seats to check that the latches hold
- (3) Check the seat heaters on vehicles equipped with heated seats (Fig. 19).
- (4) Check all seat head restraints (Fig. 20).
- (5) Check that all seats are securely located in their adjustable tracks.

INSPECTION - WINDOWS, DOORS AND LOCKS

- (1) Check all power window switches (Fig. 21) for proper operation.
- (2) Run all power or manually operated door, quarter and vent windows to the fully closed position to check operation and sealing.
- (3)
- (4) Check all power/manual door locks (Fig. 21) for correct operation.
- (5) Ensure that all doors open/close easily.
- (6) Test the remote fuel door release, if so equipped.

BODY INTERIOR (Continued)

Fig. 19 Seat Heater Switches

Fig. 20 Seat Head Restraints

- (7) Check that the glove box door opens/closes easily.
- (8) Check that the console door opens/closes easily.
- (9) Ensure that the sunroof opens/closes easily if so equipped.

INSTALLATION - SHIPPED LOOSE ITEMS

- (1) Install the antenna mast.
- (2) Install rear license plate holder and front license plate holder (if required).
- (3) Install wheel covers (if required).

Fig. 21 POWER WINDOW AND LOCK SWITCHES

- 1 - Power Door Lock Switch
- 2 - Window/Door Lock Switch Control Panel - Drivers Door

ROAD TEST

DESCRIPTION - ROAD TEST INSPECTION

The following items must be inspected during the road test portion of the new vehicle inspection.

- Check neutral safety switch operation
- Check operation of shift/clutch interlock system
- Check operation of gauges and warning lights
- Check horn operation
- Check operation of turn signals and emergency flashers
- Check all mirror adjustments, including day/night function
- Check windshield wipers for proper wipe pattern and intermittent mode (if equipped)
- Check washer spray pattern
- Check heater, defroster and air conditioning for proper operation
- Check that the fan operates quietly
- Check the rear window defroster (if equipped)
- Leave air selection lever in the fresh air position
- Check the rear heater and air conditioning for proper operation
- Check the rear air register locations
- Check that the indicator lamps operate properly
- Check the operation of the radio, cassette and/or compact disc player, and that sound quality is good
- Ensure that the clock displays the correct time

ROAD TEST (Continued)

- Check that the trip computer/maintenance reminder operates in all modes
- Check all speed control functions
- Check the service brakes to ensure that they stop the vehicle in a straight line, without noise, shudder or vibration
- Check the brake warning light
- Check the parking brake operation
- Check the engine's performance
- Check the transmission's performance for smooth, quiet operation. If the vehicle is a 4x4, check that the transfer case shifts easily among all ranges
- Check Autostick function (if equipped)
- Check the vehicle's steering and handling
- The steering wheel should be centered when traveling in a straight line
- The vehicle should not pull or vibrate
- Check for squeaks, rattles and wind noise
- Check any other vehicle aspects you believe are important, but that may not be included on the New Vehicle Preparation Form
- Fill fuel tank with specified grade of fuel

INSPECTION - FUEL

Fill fuel tank with specified grade of gasoline (regular, midgrade or premium).

INSPECTION - OTHER

As part of DaimlerChrysler's Customer One philosophy, the "Other" blank is provided on the New Vehicle Preparation Form. This is designed to encourage you to check any aspects of vehicle operation that you believe are important to your customers, but that do not appear elsewhere on the form.

INSPECTION - SQUEAKS, RATTLES AND WIND NOISE

- (1) Make sure that the instrument panel, glove box, seats, steering wheel and column are free from squeaks and rattles. Tighten any obvious loose fasteners.
- (2) Check that the windows and doors are free from squeaks, rattles and wind noise.
- (3) Check that the vehicle exterior is free from squeaks, rattles and noise, front and rear.
- (4) Make sure that all interior panels are free from squeaks and rattles.

INSPECTION - STEERING AND HANDLING

- (1) Check that the power assist works properly (if equipped). Steering should not require excessive effort.
- (2) Make sure the steering wheel does not vibrate at idle or road speed.
- (3) Ensure that the steering wheel is centered when traveling straight ahead.

- (4) Check that the vehicle does not drift to one side.
- (5) Make sure that the vehicle does not vibrate/shake.

INSPECTION - TRANSMISSION/TRANSFER CASE

- (1) Make sure that the park lock holds the vehicle. With the vehicle on a grade, put transmission in PARK and slowly release the service brake to see if park lock holds. If it does not hold, the transmission requires further service.
- (2) Make sure shift lever operates easily/smoothly.
- (3) Check for smooth shifting. Check for proper upshifting and downshifting.
- (4) Shift the transfer case through all ranges to make sure shifting is smooth and all gear positions respond accordingly.

INSPECTION - ENGINE PERFORMANCE

Check the engine for proper performance. It should:

- Start promptly
- Be free from stalling
- Idle smoothly and at proper speed
- Be free from stumbling or hesitation
- Produce sufficient power
- Be free from unusual noises
- Operate within the proper temperature range
- Stop when the ignition key is shut off

INSPECTION - PARKING BRAKE

- (1) Ensure that the parking brake is easy to operate.
- (2) Make sure the parking brake does not drag.
- (3) With the vehicle stopped on a grade, firmly apply the service brakes, place the transmission in NEUTRAL and set the parking brake. Slowly release the service brakes to see if the parking brake will hold.
- (4) Check that the parking brake warning light comes on when the parking brake is applied, and is off when the brake is released.

INSPECTION - SERVICE BRAKES

- (1) Check brake warning light operation at vehicle startup.
- (2) Check ABS warning light operation at vehicle startup.
- (3) Inspect service brake pedal travel and feel.
- (4) Put the vehicle in gear and apply the brakes while the car is in motion. Be sure brake operation is smooth and positive.
- (5) Make sure that the vehicle stops in a straight line, without pulling to one side.

ROAD TEST (Continued)

(6) Check that the brakes operate quietly, without noise.

(7) Ensure there is no shudder or vibration when braking.

INSPECTION - SPEED CONTROL

Check the following speed control functions:

- Check on/off switch
- Check "set" operation
- Check "resume" function
- Check "accelerate" and "decelerate" functions
- Check brake release function
- Check "cancel" function

INSPECTION - TRIP COMPUTER/MAINTENANCE REMINDER

NOTE: Reset the average fuel economy when the road test is complete.

80984420

Fig. 22 TRIP/MAINTENANCE COMPUTER

Check that all modes operate correctly (Fig. 22).

INSPECTION - RADIO, TAPE PLAYER AND/OR CD PLAYER

- (1) Check for good AM/FM reception.
- (2) Ensure that the cassette and/or compact disc (CD) player works properly.
- (3) Check for good sound quality from all speakers.
- (4) Ensure that the radio (Fig. 23) displays the correct time.
- (5) Check the steering wheel controls (if equipped).

809219af

Fig. 23 RADIO AND TAPE PLAYER

INSPECTION - HEATER/AIR CONDITIONER

- (1) Check that heater/defroster works properly.
- (2) Turn on the heater when the engine reaches operating temperature.
- (3) Operate the blower motor in all speeds.
- (4) Operate system in all modes (Fig. 24) (heat, defrost, etc.).
- (5) Operate the rear heater (if equipped).
- (6) Check for hot air output at all outlets.
- (7) Operate temperature levers.
- (8) Ensure that rear defroster works.
- (9) Turn on rear defroster during drive, then feel window for warmth after drive.
- (10) Turn on air conditioning system.
- (11) Check that the air conditioner cools properly.
- (12) Activate the A/C in all modes (Fig. 24). (Make sure all modes work properly including rear unit if equipped.).
- (13) Operate blower motor switch at all speeds.
- (14) Check for cold output at outlets.
- (15) Check that fan operation is quiet.

809219b9

Fig. 24 HEATER/AIR CONDITIONING CONTROLS

INSPECTION WINDSHIELD WIPERS/WASHERS

- (1) Check washer spray pattern for proper operation and aim.
- (2) Check intermittent wipe feature for proper operation.

ROAD TEST (Continued)

(3) Inspect wiper blades, check for proper wiping pattern-no streaking or missed areas.

INSPECTION - MIRRORS

(1) Check operation of rear view mirror's (Fig. 25) and (Fig. 26) day/night function (if equipped).

(2) Check ease of adjustment for all mirrors (power or manual).

Fig. 25 DOOR MOUNTED REAR VIEW MIRROR

Fig. 26 INTERIOR REAR VIEW MIRROR

INSPECTION - TURN AND EMERGENCY SIGNALS

(1) Ensure that the turn signals work properly (including canceling after completing a turn).

(2) Ensure that the emergency flashers work properly.

INSPECTION - HORN

Ensure that the horn works properly.

INSPECTION - GAUGES/WARNING LIGHTS

(1) Ensure that all gauges, instrument indicator lights, warning lights and instrument panel lights (Fig. 27) are functioning properly.

Fig. 27 INSTRUMENT CLUSTER GAUGES AND WARNING LIGHTS

- 1 - BATTERY VOLTAGE GAUGE
- 2 - LEFT TURN INDICATOR LAMP
- 3 - TECHOMETER
- 4 - SPEEDOMETER
- 5 - RIGHT TURN INDICATOR LAMP
- 6 - ENGINE OIL PRESSURE GAUGE
- 7 - ENGINE COOLANT TEMPERATURE GAUGE
- 8 - SEAT BELT INDICATOR LAMP
- 9 - FUEL GAUGE

(2) Inspect operation of message center (if equipped).

INSPECTION - SHIFT/CLUTCH INTERLOCK SYSTEM

(1) On vehicles with a manual transmission or transaxle, be sure engine starts only when clutch is depressed.

(2) Some vehicles equipped with an automatic transaxle also have a brake interlock system. On these vehicles, be sure that you cannot shift out of PARK without pressing the brake pedal.

INSPECTION - NEUTRAL SAFETY SWITCH

(1) On vehicles with an automatic transmission or transaxle, check shift indicator alignment in all ranges.

(2) Be sure the engine starts in both PARK and NEUTRAL.

(3) Verify that the engine does not start in any REVERSE/DRIVE positions.

PRE DELIVERY STORAGE**DESCRIPTION**

Pre Delivery Storage information is provided to recommend practices to use when storing new vehicles prior to delivery to the customer.

PRE DELIVERY STORAGE (Continued)

If you have prepared a vehicle that will not be immediately delivered to the customer, store the vehicle according to guidelines outlined in (Refer to 30 - NEW VEHICLE PREP/PREDELIVERY STORAGE - STANDARD PROCEDURE) to prevent unnecessary wear and tear on the vehicles electrical systems, paint and finish and damage due to pilferage and vandalism.

STANDARD PROCEDURE - PRE DELIVERY STORAGE

(1) If possible, store vehicles indoors, in clean, dry places. If vehicles must be stored outdoors:

- Try to avoid storage locations that are near any obvious sources of industrial or environmental contamination (e.g., trees, factories, steam or vapor vents, railroad tracks, etc.)

- Maintain tight security to help prevent pilferage and vandalism, and inspect each vehicle regularly to check for such damage

- If the vehicle must be parked on an incline, park it with the front end higher than the rear; this will prevent “hydrostatic lock” caused by fuel draining into the engine

- Rinse the vehicle at least once a week. Snow should be washed away more often, since it can trap harmful contaminants. Dry all horizontal surfaces

(2) The IOD fuse should be removed in order to prevent battery drain and possible damage.

(3) Check the vehicle’s coolant and anti-freeze protection.

(4) Check the vehicle’s battery at least once a month for a proper charge (at least 12.4 volts). Charge the battery if necessary. This will help prevent freezing and deterioration.

(5) Check the vehicle’s tires and inflate them to their maximum recommended levels. Move the vehicles periodically to avoid “flatspotting” the tires.

(6) Do not engage the parking brake; keep it in the OFF position.

(7) Keep all windows closed, all doors locked, and all trim covers intact and in place.

(8) Do not use chalks, crayons or any marker containing abrasives on painted, plated or glass surfaces.

(9) Always use seat covers when moving a vehicle.

PROGRAMMABLE ELECTRONIC FEATURES

DESCRIPTION

The programming of electronic features applies to specific DaimlerChrysler Corporation vehicles. Not all vehicles are equipped with these electronic features, and not all vehicles equipped with electronic

features have all the available features. Programmable electronic features are subject to change and may be added or deleted from specific vehicle models.

(1) The programmable electronic features that may be provided on the vehicle are:

- Rolling Power Door Locks
- Horn Chirp (When Doors Locked With Remote Keyless Entry)
- Headlamp Flash (When Doors Locked or Unlocked With Remote Keyless Entry)
- Low Fuel Chime
- Remote Keyless Entry Door Unlock Sequence
- Headlights On Automatically With Wipers
- Turn Signal Chime
- 12V Power Outlet
- Remote Unlock
- Remote Linked To Memory
- Headlamp Delay
- Service Interval
- Easy Exit Seat

(2) Programming any of the above features is to be performed prior to vehicle delivery to the customer, depending on customer preference.

NOTE: For all vehicles except Caravan/Voyager/Town and Country, the programming must be performed using the DRB III scan tool. On Caravan/Voyager/Town and Country vehicles the features can be programmed using the DRB III scan tool or by button pushing sequences. The customer can perform programming, if desired, by following the instructions outlined in the owner manual.

OPERATION

NOTE: The programmable features provided on vehicles need to be explained to the customer at the time of sale. The customer’s preferences concerning the features should be noted and programmed accordingly during predelivery.

NOTE: When using the DRB III® scan tool to enable/disable any programmable electronic features, go to the main menu item #9 on the DRB III® scan tool. This is “Customer Preferences”. You must choose “Customer Preferences” on the main menu to program the desired features.

ROLLING POWER DOOR LOCKS

With this feature enabled, the vehicle’s door locking mechanisms automatically lock when the vehicle reaches approximately 24 Km/h (15 mph).

PROGRAMMABLE ELECTRONIC FEATURES (Continued)

HORN CHIRP

NOTE: This feature can be enabled with or without the headlamp flash feature.

The horn chirp function is a feature that can be enabled or disabled on vehicles equipped with Remote Keyless Entry (RKE). The horn chirps when the vehicle is locked with the RKE transmitter.

HEADLAMP FLASH

NOTE: This feature can be enabled with or without the horn chirp feature.

The headlamp flash function is a feature that can be enabled or disabled on vehicles equipped with Remote Keyless Entry (RKE). The headlamps flash once when the vehicle is locked with the RKE transmitter, and flash twice when the vehicle is unlocked with the RKE transmitter.

LOW FUEL CHIME

All vehicles equipped with the audible low fuel chime are shipped with this feature enabled.

REMOTE KEYLESS ENTRY (RKE) DOOR UNLOCK SEQUENCE

Two door unlock sequences are provided on vehicles equipped with this feature. When using the RKE transmitter to unlock the doors, pressing the unlock button once when the feature is enabled unlocks only the driver's door. Pushing the RKE transmitter unlock button a second time unlocks the remaining doors. When the RKE door unlock feature is disabled, all doors unlock with one press of the RKE transmitter unlock button.

HEADLIGHTS ON AUTOMATICALLY WITH WIPERS

This feature appears on vehicles that have, as an option, automatic headlights. When the windshield wipers are turned on, the headlights automatically turn on.

12V POWER OUTLET

This feature currently appears on Caravan/Voyager/Town and Country vehicles. The vehicles are shipped with the 12V power outlets turned off with the ignition key. The relay can be changed to make the outlets powered at all times. This feature may be of interest to customers with cell phones.

TURN SIGNAL CHIME

This feature is an audible turn signal warning chime. The chime sounds if the turn signal is on, the vehicle has traveled one mile and vehicle speed has exceeded 40 Km/h (25 mph).

REMOTE UNLOCK

The remote unlock function is a feature that can be enabled or disabled on vehicles equipped with Remote Keyless Entry (RKE). With the first press of the RKE transmitter to unlock the doors, the driver's door only unlocks. With the second press of the RKE transmitter, the remaining doors and the liftgate unlock. With the remote unlock feature enabled, the first press of the RKE transmitter unlocks all doors.

REMOTE LINKED TO MEMORY

The remote linked to memory function is currently only available only on Jeep Grand Cherokee Limited vehicles. When enabled, this feature recalls a memory of seats, mirror and radio presets and positions when unlocking the vehicle with the RKE transmitter.

HEADLAMP DELAY

Currently available only on Jeep Grand Cherokee vehicles, the headlamp delay timeout can be set to 30, 60 or 90 seconds. This timeout only occurs when the ignition is turned off prior to turning the headlamps off, or when leaving the headlamps in AUTO mode.

SERVICE INTERVAL

Currently available only on Jeep Grand Cherokee vehicles, the interval for the service reminder message can be set from 3,219 kilometers to 12,070 kilometers (2,000 miles to 7,500 miles).

EASY EXIT SEAT

Currently available only on Jeep Grand Cherokee Limited vehicles, the driver's seat will reposition 55mm (2.1 inches) rearward, or the end of travel if less than 55mm (2.1 inches) and full downward when the key is removed from the ignition. This feature allows ease of exiting the vehicle. The seat will reposition itself to the memory location when the vehicle is unlocked using the RKE transmitter or by pressing the memory buttons on the door panel.

APPEARANCE TIPS**CLEANING**

(1) Before delivering the new vehicle to the customer, the following checks on appearance details are recommended:

- Wash the vehicle to remove all traces of road grime and other dirt on the car from new vehicle preparation operations
- Clean the tire sidewalls
- Clean exterior and interior glass surfaces
- Remove all protective covers

APPEARANCE TIPS (Continued)

- Remove undercoat overspray, excess window sealer, and excess weatherstrip adhesive
- Inspect interior trim, seats, carpeting, and moldings. Clean as necessary
- Remove shipping and inspection stickers
- After the vehicle is clean, inspect the paint again

(2) Mopar® offers a wide variety of car care products, developed to meet your dealership's requirements. All are specifically formulated for DaimlerChrysler vehicles

FINAL STEPS

NEW VEHICLE PREPARATION FORM

Complete the Emission Certification Of Conformity Statement on the bottom of the New Vehicle Preparation Form (Fig. 1) in the glove box or storage box

after it has been completed and signed by the designated individual.

OWNER CHECK OUT

The last step in the new vehicle preparation procedure is to help the customer become familiar with the features on their new vehicle. Show the new owner where the controls and gauges are and explain how they operate.

INSPECTION - INFORMATION LABELS

Verify that the following labels are installed and legible.

- Emission control labels
- Monroney label
- Tire pressure label
- Vehicle certification label

DOORS AND LOCKS - INSPECTION, WINDOWS	30-10	DUCT - INSTALLATION, REAR FLOOR HEAT	24-41	ENGINE - DESCRIPTION, COOLING SYSTEM 4.0L	7-3
DOUBLE CARDAN UNIVERSAL JOINTS - ASSEMBLY	3-11	DUCT - REMOVAL, INSTRUMENT PANEL STRUCTURAL	23-140	ENGINE - DESCRIPTION, COOLING SYSTEM 4.7L	7-1
DOUBLE CARDAN UNIVERSAL JOINTS - DISASSEMBLY	3-10	DUCT - REMOVAL, REAR FLOOR HEAT	24-40	ENGINE - DESCRIPTION, COOLING SYSTEM ROUTING 4.0L	7-3
DOUBLE INVERTED FLARING - STANDARD PROCEDURE	5-7	DUCTS - INSTALLATION, DEFROSTER	24-39	ENGINE - DESCRIPTION, COOLING SYSTEM ROUTING 4.7L	7-1
D-PILLAR AIR EXHAUSTER - INSTALLATION	23-115	DUCTS - INSTALLATION, INSTRUMENT PANEL	24-39	ENGINE - DESCRIPTION, EXHAUST SYSTEM 4.0L	11-1
D-PILLAR AIR EXHAUSTER - REMOVAL	23-115	DUCTS - REMOVAL, DEFROSTER	24-38	ENGINE - ENGINE FIRING ORDER, 4.0L 6-CYLINDER	8I-2
D-PILLAR APPLIQUE - INSTALLATION	23-115	DUCTS - REMOVAL, FLOOR DISTRIBUTION	24-39	ENGINE - ENGINE FIRING ORDER, 4.7L V-8	8I-2
D-PILLAR APPLIQUE - REMOVAL	23-115	DUCTS - REMOVAL, INSTRUMENT PANEL	24-39	ENGINE - IGNITION COIL RESISTANCE, 4.0L	8I-2
D-PILLAR TRIM - INSTALLATION	23-163	EFFECTS OF INCORRECT FLUID LEVEL - DIAGNOSIS AND TESTING	21-136,21-292	ENGINE - IGNITION COIL RESISTANCE, 4.7L V-8	8I-2
D-PILLAR TRIM - REMOVAL	23-163	ELECTRIC ACTUATOR - INSTALLATION, HEAT/DEFROST - PANEL/DEFROST DOOR	24-32	ENGINE - INSTALLATION, 4.0L	7-18,7-20,7-34,7-36,7-38
DRAG LINK - DESCRIPTION	19-33	ELECTRIC ACTUATOR - INSTALLATION, RECIRCULATION DOOR	24-34	ENGINE - INSTALLATION, 4.7L	7-18,7-23,7-34,7-36,7-38
DRAG LINK - INSTALLATION	19-33	ELECTRIC ACTUATOR - REMOVAL, HEAT/DEFROST - PANEL/DEFROST DOOR	24-31	ENGINE - INSTALLATION, 4.7L	19-38
DRAG LINK - OPERATION	19-33	ELECTRIC ACTUATOR - REMOVAL, RECIRCULATION DOOR	24-34	ENGINE - REMOVAL, 4.0L	7-17,7-20,7-34,7-35,7-37
DRAG LINK - REMOVAL	19-33	ELECTRIC BRAKE - DESCRIPTION	5-38	ENGINE - REMOVAL, 4.7L	19-38
DRAINBACK VALVE - DESCRIPTION, TORQUE CONVERTER	21-198	ELECTRIC BRAKE - OPERATION	5-38	ENGINE - REMOVAL, 4.7L	7-38
DRAINBACK VALVE - OPERATION, TORQUE CONVERTER	21-198	ELECTRIC COOLING FAN - DIAGNOSIS AND TESTING	7-47	ENGINE - REMOVAL, 4.7L	19-38
DRAINBACK VALVE - STANDARD PROCEDURES, TORQUE CONVERTER	21-198	ELECTRICAL CONTROLS - DIAGNOSIS AND TESTING, OVERDRIVE	21-153	ENGINE - STANDARD PROCEDURE, DRAINING COOLING SYSTEM - 4.0L	7-14
DRAINING COOLING SYSTEM - 4.0L ENGINE - STANDARD PROCEDURE	7-14	ELECTROLYTE LEVEL - STANDARD PROCEDURE, CHECKING BATTERY	8F-9	ENGINE - STANDARD PROCEDURE, REFILLING COOLING SYSTEM - 4.0L	7-15
DRAINING COOLING SYSTEM 4.7L ENGINE - STANDARD PROCEDURES	7-13	ELECTRONIC FEATURES - DESCRIPTION, PROGRAMMABLE	30-15	ENGINE - STANDARD PROCEDURES, DRAINING COOLING SYSTEM 4.7L	7-13
DRAW FUSE - DESCRIPTION, IGNITION-OFF	8W-3	ELECTRONIC FEATURES - OPERATION, PROGRAMMABLE	30-15	ENGINE - STANDARD PROCEDURES, REFILLING COOLING SYSTEM 4.7L	7-14
DRAW FUSE - INSTALLATION, IGNITION-OFF	8W-4	ELECTRONIC GOVERNOR - DESCRIPTION	21-130	ENGINE - TORQUE, 4.0L	9-17
DRAW FUSE - OPERATION, IGNITION-OFF	8W-3	ELECTRONIC GOVERNOR - INSTALLATION	21-134	ENGINE, 4.0L	9-14
DRAW FUSE - REMOVAL, IGNITION-OFF	8W-4	ELECTRONIC GOVERNOR - OPERATION	21-132	ENGINE 4.7L - INSTALLATION	9-74
DRAW TEST - STANDARD PROCEDURE, IGNITION-OFF	8F-16	ELECTRONIC GOVERNOR - REMOVAL	21-133	ENGINE 4.7L - REMOVAL	9-72
DRAW WIRE HARNESS CONNECTOR - DESCRIPTION, IGNITION-OFF	8W-17	ELECTRONIC VEHICLE INFO CENTER - DESCRIPTION	8M-6	ENGINE BLOCK - CLEANING	9-107,9-29
DRAW WIRE HARNESS CONNECTOR - OPERATION, IGNITION-OFF	8W-18	ELECTRONIC VEHICLE INFO CENTER - INSTALLATION	8M-9	ENGINE BLOCK - DESCRIPTION	9-107
DRILLING AND WELDING - STANDARD PROCEDURES	23-3	ELECTRONIC VEHICLE INFO CENTER - OPERATION	8M-8	ENGINE BLOCK - INSPECTION	9-108,9-30
DRIVE - DIAGNOSIS AND TESTING, VISCOUS FAN	7-40	ELECTRONIC VEHICLE INFO CENTER - REMOVAL	8M-9	ENGINE BLOCK HEATER - DIAGNOSIS AND TESTING	7-33
DRIVE BELT - DIAGNOSIS AND TESTING, SERPENTINE	7-18,7-21	ELECTRONIC VEHICLE INFORMATION CENTER PROGRAMMING - STANDARD PROCEDURE	8M-2	ENGINE BLOCK HEATER - OPERATION	7-33
DRIVE SYSTEM - DESCRIPTION, TIMING	9-140	ELEMENT - DESCRIPTION, HEATED SEAT	8G-7	ENGINE COOLANT TEMP SENSOR - DESCRIPTION	7-35
DRIVE SYSTEM - OPERATION, TIMING	9-141	ELEMENT - DIAGNOSIS & TESTING, HEATED SEAT	8G-7	ENGINE COOLANT TEMP SENSOR - OPERATION	7-35
DRIVE VISCOUS CLUTCH - 4.0L - DESCRIPTION, FAN	7-39	ELEMENT - OPERATION, HEATED SEAT	8G-7	ENGINE COOLANT THERMOSTAT - OPERATION	7-36
DRIVE VISCOUS CLUTCH - 4.0L - OPERATION, FAN	7-40	EMERGENCY SIGNALS - INSPECTION, TURN	30-14	ENGINE CORE AND OIL GALLERY PLUGS - STANDARD PROCEDURE	9-11,9-72
DRIVER - INSTALLATION, INSTRUMENT PANEL TRIM BEZEL	23-154	EMERGENCY TOW HOOKS - DESCRIPTION	0-14	ENGINE DIAGNOSIS - INTRODUCTION - DIAGNOSIS AND TESTING	9-3,9-64
DRIVER - REMOVAL, INSTRUMENT PANEL TRIM BEZEL	23-154	EMISSION CONTROL SYSTEM - DESCRIPTION	25-1	ENGINE FIRING ORDER, 4.0L 6-CYLINDER ENGINE	8I-2
DRIVER AIRBAG - ASSEMBLY	80-16	END - DESCRIPTION, TIE ROD	19-34	ENGINE FIRING ORDER, 4.7L V-8 ENGINE	8I-2
DRIVER AIRBAG - DESCRIPTION	80-13	END - INSTALLATION, TIE ROD	19-34	ENGINE GASKET SURFACE PREPARATION - STANDARD PROCEDURES	9-71
DRIVER AIRBAG - DISASSEMBLY	80-15	END - OPERATION, TIE ROD	19-34	ENGINE OIL - DESCRIPTION	0-3
DRIVER AIRBAG - INSTALLATION	80-17	END - REMOVAL, TIE ROD	19-34	ENGINE OIL - STANDARD PROCEDURE	9-129
DRIVER AIRBAG - OPERATION	80-14	END CAP - INSTALLATION, INSTRUMENT PANEL	23-140	ENGINE OIL, FLUID TYPES	0-2
DRIVER AIRBAG - REMOVAL	80-14	END CAP - REMOVAL, INSTRUMENT PANEL	23-139	ENGINE OIL LEAK - DIAGNOSIS AND TESTING	9-51
DRIVER DOOR AJAR SWITCH - DESCRIPTION	8L-33	END PLAY - STANDARD PROCEDURE, CRANKSHAFT	9-110	ENGINE OIL LEAK INSPECTION - DIAGNOSIS AND TESTING	9-128
DRIVER DOOR AJAR SWITCH - OPERATION	8L-33	ENGINE - 4.0L - DESCRIPTION	9-2	ENGINE OIL PRESSURE - DIAGNOSIS AND TESTING	9-127,9-51
DRIVER HEATED SEAT SWITCH - DESCRIPTION	8G-5			ENGINE OIL PRESSURE SENSOR - DESCRIPTION	9-56
DRIVER HEATED SEAT SWITCH - INSTALLATION	8G-7			ENGINE OIL PRESSURE SENSOR - OPERATION	9-56

FRONT WHEEL SPEED SENSOR - REMOVAL	5-38	FUEL TANK SKID PLATE - DESCRIPTION	13-7	GEARTRAIN/OUTPUT SHAFT - DESCRIPTION, PLANETARY	21-177
FRONT WIPER & WASHER SYSTEM - CLEANING	8R-7	FUSE - DESCRIPTION, IGNITION-OFF DRAW	8W-3	GEARTRAIN/OUTPUT SHAFT - DISASSEMBLY, PLANETARY	21-178
FRONT WIPER & WASHER SYSTEM - DIAGNOSIS AND TESTING	8R-4	FUSE - INSTALLATION, IGNITION-OFF DRAW	8W-4	GEARTRAIN/OUTPUT SHAFT - INSPECTION, PLANETARY	21-178
FRONT WIPER & WASHER SYSTEM - INSPECTION	8R-7	FUSE - OPERATION, IGNITION-OFF DRAW	8W-3	GEARTRAIN/OUTPUT SHAFT - OPERATION, PLANETARY	21-177
FRONT WIPER ARM - DESCRIPTION	8R-12	FUSE - REMOVAL, IGNITION-OFF DRAW	8W-4	GENERAL - WARNINGS	8W-4
FRONT WIPER ARM - INSTALLATION	8R-13	FUSE COVER - INSTALLATION	8W-19	GENERATOR - DESCRIPTION	8F-30
FRONT WIPER ARM - OPERATION	8R-13	FUSE COVER - REMOVAL	8W-18	GENERATOR - INSTALLATION	8F-31
FRONT WIPER ARM - REMOVAL	8R-13	FUSES POWERING SEVERAL LOADS - STANDARD PROCEDURE, TESTING	8W-7	GENERATOR - OPERATION	8F-30
FRONT WIPER BLADE - DESCRIPTION	8R-14	FOR SHORT TO GROUND ON	8W-7	GENERATOR - REMOVAL	8F-31
FRONT WIPER BLADE - INSTALLATION	8R-14	GALLERY PLUGS - STANDARD PROCEDURE, ENGINE CORE AND OIL	9-11,9-72	GENERATOR RATINGS, GAS POWERED	8F-29
FRONT WIPER BLADE - OPERATION	8R-14	GAP AND FLUSH MEASUREMENTS, SPECIFICATIONS - BODY	23-87	GLASS - DESCRIPTION, STATIONARY	23-182
FRONT WIPER BLADE - REMOVAL	8R-14	GARAGE DOOR OPENER - DIAGNOSIS & TESTING, UNIVERSAL	8M-10	GLASS - INSTALLATION, DOOR	23-100,23-108, 23-182
FRONT WIPER MODULE - DESCRIPTION	8R-15	GAS POWERED - GENERATOR RATINGS	8F-29	GLASS - INSTALLATION, FLIP-UP	23-94
FRONT WIPER MODULE - INSTALLATION	8R-16	GAS POWERED - STARTER MOTOR	8F-39	GLASS - INSTALLATION, SIDE VIEW MIRROR	23-120
FRONT WIPER MODULE - OPERATION	8R-15	GAS POWERED - TORQUE	8F-29	GLASS - OPERATION, STATIONARY	23-182
FRONT WIPER MODULE - REMOVAL	8R-16	GAS PROP - INSTALLATION	23-121	GLASS - REMOVAL, DOOR	23-100,23-108, 23-182
FRONT WIPERS/WASHERS - DESCRIPTION	8R-2	GAS PROP - REMOVAL	23-121	GLASS - REMOVAL, FLIP-UP	23-93
FRONT WIPERS/WASHERS - OPERATION	8R-3	GASKET - DIAGNOSIS AND TESTING, CYLINDER HEAD	9-83,9-96	GLASS - REMOVAL, SIDE VIEW MIRROR	23-119
FUEL - INSPECTION	30-12	GASKET SURFACE PREPARATION - STANDARD PROCEDURES, ENGINE	9-71	GLASS AJAR SWITCH - DESCRIPTION, FLIP UP	8L-32
FUEL DELIVERY - DESCRIPTION	14-1	GASKETS & SEALERS - STANDARD PROCEDURE, FORM-IN-PLACE	9-70,9-9	GLASS AJAR SWITCH - OPERATION, FLIP UP	8L-33
FUEL DELIVERY - OPERATION	14-2	GAUGE - DESCRIPTION, ENGINE TEMPERATURE	8J-17	GLASS HEATING GRID REPAIR - STANDARD PROCEDURE, REAR	8G-15
FUEL DELIVERY - TORQUE	14-4	GAUGE - DESCRIPTION, FUEL	8J-19	GLASS LATCH - INSTALLATION, FLIP-UP	23-94
FUEL FILL DOOR - INSTALLATION	23-117	GAUGE - DESCRIPTION, OIL PRESSURE	8J-24	GLASS LATCH - REMOVAL, FLIP-UP	23-94
FUEL FILL DOOR - REMOVAL	23-117	GAUGE - DESCRIPTION, VOLTAGE	8J-31	GLASS LATCH STRIKER - INSTALLATION, FLIP-UP	23-95
FUEL FILLER CAP - DESCRIPTION	25-28	GAUGE - OPERATION, ENGINE TEMPERATURE	8J-18	GLASS LATCH STRIKER - REMOVAL, FLIP-UP	23-95
FUEL FILLER CAP - OPERATION	25-28	GAUGE - OPERATION, FUEL	8J-19	GLASS POWER RELEASE SYSTEM - DESCRIPTION, LIFTGATE FLIP-UP	8N-4
FUEL FILLER CAP - REMOVAL	25-28	GAUGE - OPERATION, OIL PRESSURE	8J-24	GLASS POWER RELEASE SYSTEM - DIAGNOSIS AND TESTING, LIFTGATE FLIP-UP	8N-6
FUEL FILTER/PRESSURE REGULATOR - DESCRIPTION	14-5	GAUGE - OPERATION, VOLTAGE	8J-31	GLASS POWER RELEASE SYSTEM - OPERATION, LIFTGATE FLIP-UP	8N-5
FUEL FILTER/PRESSURE REGULATOR - INSTALLATION	14-6	GAUGE SENDING UNIT - DIAGNOSIS AND TESTING, FUEL	14-7	GLASS RUN CHANNEL - INSTALLATION	23-101
FUEL FILTER/PRESSURE REGULATOR - OPERATION	14-6	GAUGES - DIAGNOSIS AND TESTING, PRESSURE	22-7	GLASS RUN CHANNEL - REMOVAL	23-101
FUEL FILTER/PRESSURE REGULATOR - REMOVAL	14-6	GAUGES INDICATOR - DESCRIPTION, CHECK	8J-16	GLASS RUN WEATHERSTRIP - INSTALLATION, FRONT DOOR	23-187
FUEL GAUGE - DESCRIPTION	8J-19	GAUGES INDICATOR - OPERATION, CHECK	8J-16	GLASS RUN WEATHERSTRIP - REMOVAL, FRONT DOOR	23-187
FUEL GAUGE - OPERATION	8J-19	GAUGES/WARNING LIGHTS - INSPECTION	30-14	GLASS SWITCH - INSTALLATION, FLIP-UP	23-95
FUEL GAUGE SENDING UNIT - DIAGNOSIS AND TESTING	14-7	GEAR - ADJUSTMENTS, STEERING	19-17	GLASS SWITCH - REMOVAL, FLIP-UP	23-95
FUEL INDICATOR - DESCRIPTION, LOW	8J-21	GEAR - DESCRIPTION	19-15	GLASS WEATHERSTRIP - INSTALLATION, FLIP-UP	23-188
FUEL INDICATOR - OPERATION, LOW	8J-21	GEAR - INSTALLATION	19-15	GLASS WEATHERSTRIP - REMOVAL, FLIP-UP	23-188
FUEL INJECTION - TORQUE	14-34	GEAR - INSTALLATION, PINION GEAR/RING	3-122,3-45,3-84	GLOVE BOX - INSTALLATION	23-137
FUEL INJECTOR - DESCRIPTION	14-38	GEAR - OPERATION	19-15	GLOVE BOX - REMOVAL	23-136
FUEL INJECTOR - INSTALLATION	14-39	GEAR - REMOVAL	19-15	GLOVE BOX LAMP/SWITCH - INSTALLATION	8L-35
FUEL INJECTOR - OPERATION	14-38	GEAR - REMOVAL, PINION GEAR/RING	3-119, 3-44,3-81	GLOVE BOX LAMP/SWITCH - REMOVAL	8L-34
FUEL INJECTOR - REMOVAL	14-39	GEAR HOUSING PLUG - INSTALLATION, STEERING	19-27	GLOVE BOX LATCH - INSTALLATION	23-137
FUEL INJECTOR TEST - DIAGNOSIS AND TESTING	14-39	GEAR HOUSING PLUG - REMOVAL, STEERING	19-27	GLOVE BOX LATCH - REMOVAL	23-137
FUEL LEVEL SENDING UNIT / SENSOR - DESCRIPTION	14-7	GEAR, SPECIAL TOOLS - POWER STEERING	19-18	GLOVE BOX LATCH STRIKER - INSTALLATION	23-139
FUEL LEVEL SENDING UNIT / SENSOR - INSTALLATION	14-8	GEAR, SPECIFICATIONS - POWER STEERING	19-17	GLOVE BOX LATCH STRIKER - REMOVAL	23-138
FUEL LEVEL SENDING UNIT / SENSOR - OPERATION	14-7	GEAR/RING GEAR - INSTALLATION, PINION	3-122,3-45,3-84	GLOVE BOX ROLL DOWN - STANDARD PROCEDURE	23-136
FUEL LEVEL SENDING UNIT / SENSOR - REMOVAL	14-8	GEAR/RING GEAR - REMOVAL, PINION	3-119, 3-44,3-81	GOVERNOR - DESCRIPTION, ELECTRONIC	21-130
FUEL LINES - DESCRIPTION	14-8	GEARSHIFT CABLE - ADJUSTMENTS	21-146, 21-297	GOVERNOR - INSTALLATION, ELECTRONIC	21-134
FUEL PRESSURE LEAK DOWN TEST - DIAGNOSIS AND TESTING	14-2	GEARSHIFT CABLE - DIAGNOSIS AND TESTING	21-145,21-296	GOVERNOR - OPERATION, ELECTRONIC	21-132
FUEL PUMP - DESCRIPTION	14-9	GEARSHIFT CABLE - INSTALLATION	21-146, 21-296	GOVERNOR - REMOVAL, ELECTRONIC	21-133
FUEL PUMP - OPERATION	14-9	GEARSHIFT CABLE - REMOVAL	21-145,21-296	GRID - DESCRIPTION, REAR WINDOW DEFOGGER	8G-15
FUEL PUMP AMPERAGE TEST - DIAGNOSIS AND TESTING	14-9	GEARTRAIN - ASSEMBLY, PLANETARY	21-323	GRID - DIAGNOSIS AND TESTING, REAR WINDOW DEFOGGER	8G-15
FUEL PUMP CAPACITY TEST - DIAGNOSIS AND TESTING	14-9	GEARTRAIN - CLEANING, PLANETARY	21-323	GRID - OPERATION, REAR WINDOW DEFOGGER	8G-15
FUEL PUMP MODULE - DESCRIPTION	14-13	GEARTRAIN - DESCRIPTION, PLANETARY	21-322	GRID REPAIR - STANDARD PROCEDURE, REAR GLASS HEATING	8G-15
FUEL PUMP MODULE - INSTALLATION	14-13	GEARTRAIN - DISASSEMBLY, PLANETARY	21-323	GRILLE - INSTALLATION	23-118
FUEL PUMP MODULE - OPERATION	14-13	GEARTRAIN - INSPECTION, PLANETARY	21-323	GRILLE - INSTALLATION, COWL	23-114
FUEL PUMP MODULE - REMOVAL	14-13	GEARTRAIN - OPERATION, PLANETARY	21-322	GRILLE - REMOVAL	23-118
FUEL PUMP PRESSURE TEST - DIAGNOSIS AND TESTING	14-11	GEARTRAIN/OUTPUT SHAFT - ASSEMBLY, PLANETARY	21-179	GRILLE - REMOVAL, COWL	23-114
FUEL PUMP RELAY - DESCRIPTION	14-39				
FUEL PUMP RELAY - OPERATION	14-40				
FUEL REQUIREMENTS, SPECIFICATIONS	0-4				
FUEL SYSTEM PRESSURE RELEASE - STANDARD PROCEDURE	14-3				
FUEL SYSTEM PRESSURE, SPECIFICATIONS	14-4				
FUEL SYSTEM, SPECIAL TOOLS	14-5				
FUEL TANK - DESCRIPTION	14-18				
FUEL TANK - INSTALLATION	14-20				
FUEL TANK - OPERATION	14-19				
FUEL TANK - REMOVAL	14-19
